Dear Mool,

The Hydraulic Fracturing Regulatory Act is a regulatory floor, and in no way makes high-volume hydraulic fracturing safe. The rules developed to better define the Act were to be the foundation to establish baseline minimum protections. Unfortunately the rules developed do not reflect the law that was passed, and until strengthened will not provide baseline protections intended. Strengthen the rules by:

* clarifying chemical disclosure for first responders and medical emergencies. Medical professionals and first responders must be able to access chemical information on a 24-7 basis. [Subpart G, Section 245.730]

* eliminating potential abuse of emergency pits. First, require that drillers anticipate appropriate sized tanks for sufficient storage of flowback and produced water. Second, clarify that wastewater must be removed from the pit within 7 days of the event that triggered the use of the pit rather than 7 days after fracking operations are complete, in accordance with the law. [Subpart H, Sections 245.830  245.850]

* increasing administrative and operational penalties. Failure to comply with the law should not be a cost of doing business, increase the fines to discourage non-compliance. [Subpart K, Section245.1120]

* protecting water resources. The presumption of water pollution should extend to the full range of chemicals used in the fracking process, and not be arbitrarily limited to select "indicator chemicals". [Subpart F, Section 245.620]

* defining threshold questions. Use of foams and gases in base fluids reduce the total gallons of fluid used in the fracking process, which will limit the number of fracking operations to which the law applies. Multipliers for foams and gases in base fluids must be identified so operators are not able to skirt the law by staying under minimum thresholds. [Subpart A, Section 245.110]

* requiring all high volume hydraulic fracturing operations to be

subject to the law. We cannot allow operations that engage in HVHF to be exempt because they started prior to the adoption of the regulatory act. [Subpart A, Section 245.110]

* protecting public participation. Prevent companies from avoiding the public input process by amending their original applications; require significant permit modifications to be subject to the entire public process. [Subpart C, Section 245.330]

Laws and regulations are never going to make fracking safe. However, failure to adopt rules that reflect the baseline protections identified in the Hydraulic Fracturing Regulatory Act puts our drinking water and communities at greater risk.

I urge you to update the regulations to reflect the law.

Sincerely,

Tom Richardson

I support clean, renewable energy and energy efficiency in IL. Mool,

I support fighting global climate change by advocating for laws and policies that expand the use of homegrown renewable resources such as wind and solar.

I want my community to support renewable energy and expand local actions on sustainability.

I will support local businesses and political leaders who share the commitment to being sustainable and support my vision of protecting the environment.

Personally, I will attempt to be more energy efficient in my home, workplace, school, and transportation choices. I pledge to do my part to combat global climate change.

I Pledge,

The Hydraulic Fracturing Regulatory Act is a regulatory floor, and in no way makes high-volume hydraulic fracturing safe. The rules developed to better define the Act were to be the foundation to establish baseline minimum protections. Unfortunately the rules developed do not reflect the law that was passed, and until strengthened will not provide baseline protections intended. Strengthen the rules by:

* clarifying chemical disclosure for first responders and medical emergencies. Medical professionals and first responders must be able to access chemical information on a 24-7 basis. [Subpart G, Section 245.730]

* eliminating potential abuse of emergency pits. First, require that drillers anticipate appropriate sized tanks for sufficient storage of flowback and produced water. Second, clarify that wastewater must be removed from the pit within 7 days of the event that triggered the use of the pit rather than 7 days after fracking operations are complete,

in accordance with the law. [Subpart H, Sections 245.830 245.850]

* increasing administrative and operational penalties. Failure to comply with the law should not be a cost of doing business, increase the fines to discourage non-compliance. [Subpart K, Section245.1120]

* protecting water resources. The presumption of water pollution should extend to the full range of chemicals used in the fracking process, and not be arbitrarily limited to select "indicator chemicals". [Subpart F, Section 245.620]

* defining threshold questions. Use of foams and gases in base fluids reduce the total gallons of fluid used in the fracking process, which will limit the number of fracking operations to which the law applies. Multipliers for foams and gases in base fluids must be identified so operators are not able to skirt the law by staying under minimum thresholds. [Subpart A, Section 245.110]

* requiring all high volume hydraulic fracturing operations to be subject to the law. We cannot allow operations that engage in HVHF to be exempt because they started prior to the adoption of the regulatory act. [Subpart A, Section 245.110]

* protecting public participation. Prevent companies from avoiding the public input process by amending their original applications; require significant permit modifications to be subject to the entire public process. [Subpart C, Section 245.330]

Laws and regulations are never going to make fracking safe. However, failure to adopt rules that reflect the baseline protections identified in the Hydraulic Fracturing Regulatory Act puts our drinking water and communities at greater risk.

I urge you to update the regulations to reflect the law.

Sincerely,

Harrison Bertram

* defining threshold questions. Use of foams and gases in base fluids reduce the total gallons of fluid used in the fracking process, which will limit the number of fracking operations to which the law applies. Multipliers for foams and gases in base fluids must be identified so operators are not able to skirt the law by staying under minimum thresholds. [Subpart A, Section 245.110]

* requiring all high volume hydraulic fracturing operations to be subject to the law. We cannot allow operations that engage in HVHF to be exempt because they started prior to the adoption of the regulatory act. [Subpart A, Section 245.110]

* protecting public participation. Prevent companies from avoiding the public input process by amending their original applications; require significant permit modifications to be subject to the entire public process. [Subpart C, Section 245.330]

Laws and regulations are never going to make fracking safe. However, failure to adopt rules that reflect the baseline protections identified in the Hydraulic Fracturing Regulatory Act puts our drinking water and communities at greater risk.

I urge you to update the regulations to reflect the law.

Sincerely,

Denise Alvera

I support clean, renewable energy and energy efficiency in IL. Mool,

I support fighting global climate change by advocating for laws and policies that expand the use of homegrown renewable resources such as wind and solar.

I want my community to support renewable energy and expand local actions on sustainability.

I will support local businesses and political leaders who share the commitment to being sustainable and support my vision of protecting the environment.

Personally, I will attempt to be more energy efficient in my home, workplace, school, and transportation choices. I pledge to do my part to combat global climate change.

I Pledge,

Denise Alvera

Dear Mool,

The Hydraulic Fracturing Regulatory Act is a regulatory floor, and in no way makes high-volume hydraulic fracturing safe. The rules developed to better define the Act were to be the foundation to establish baseline minimum protections. Unfortunately the rules developed do not reflect the law that was passed, and until strengthened will not provide baseline protections intended. Strengthen the rules by:

* clarifying chemical disclosure for first responders and medical emergencies. Medical professionals and first responders must be able to access chemical information on a 24-7 basis. [Subpart G, Section 245.730]

* eliminating potential abuse of emergency pits. First, require that drillers anticipate appropriate sized tanks for sufficient storage of flowback and produced water. Second, clarify that wastewater must be removed from the pit within 7 days of the event that triggered the use of the pit rather than 7 days after fracking operations are complete, in accordance with the law. [Subpart H, Sections 245.830 245.850]

* increasing administrative and operational penalties. Failure to comply with the law should not be a cost of doing business, increase the fines to discourage non-compliance. [Subpart K, Section245.1120]

* protecting water resources. The presumption of water pollution should extend to the full range of chemicals used in the fracking process, and not be arbitrarily limited to select "indicator chemicals". [Subpart F, Section 245.620]

* defining threshold questions. Use of foams and gases in base fluids reduce the total gallons of fluid used in the fracking process, which will limit the number of fracking operations to which the law applies.

Multipliers for foams and gases in base fluids must be identified so operators are not able to skirt the law by staying under minimum thresholds. [Subpart A, Section 245.110]

* requiring all high volume hydraulic fracturing operations to be subject to the law. We cannot allow operations that engage in HVHF to be exempt because they started prior to the adoption of the regulatory act. [Subpart A, Section 245.110]

* protecting public participation. Prevent companies from avoiding the public input process by amending their original applications; require significant permit modifications to be subject to the entire public process. [Subpart C, Section 245.330]

Laws and regulations are never going to make fracking safe. However, failure to adopt rules that reflect the baseline protections identified in the Hydraulic Fracturing Regulatory Act puts our drinking water and communities at greater risk.

Use of foams and gases in base fluids reduce the total gallons of fluid used in the fracking process, which will limit the number of fracking operations to which the law applies. Multipliers for foams and gases in base fluids must be identified so operators are not able to skirt the law by staying under minimum thresholds. [Subpart A, Section 245.110]

* requiring all high volume hydraulic fracturing operations to be subject to the law. We cannot allow operations that engage in HVHF to be exempt because they started prior to the adoption of the regulatory act. [Subpart A, Section 245.110]

* protecting public participation. Prevent companies from avoiding the public input process by amending their original applications; require significant permit modifications to be subject to the entire public process. [Subpart C, Section 245.330]

Laws and regulations are never going to make fracking safe. However, failure to adopt rules that reflect the baseline protections identified in the Hydraulic Fracturing Regulatory Act puts our drinking water and communities at greater risk.

I urge you to update the regulations to reflect the law.

Sincerely,

Natalie Rook

Dear Mool,

The Hydraulic Fracturing Regulatory Act is a regulatory floor, and in no way makes high-volume hydraulic fracturing safe. The rules developed to better define the Act were to be the foundation to establish baseline minimum protections. Unfortunately the rules developed do not reflect the law that was passed, and until strengthened will not provide baseline protections intended. Strengthen the rules by:

* clarifying chemical disclosure for first responders and medical emergencies. Medical professionals and first responders must be able to access chemical information on a 24-7 basis. [Subpart G, Section 245.730]

* eliminating potential abuse of emergency pits. First, require that drillers anticipate appropriate sized tanks for sufficient storage of flowback and produced water. Second, clarify that wastewater must be removed from the pit within 7 days of the event that triggered the use of the pit rather than 7 days after fracking operations are complete, in accordance with the law. [Subpart H, Sections 245.830 245.850]

* increasing administrative and operational penalties. Failure to comply with the law should not be a cost of doing business, increase the fines to discourage non-compliance. [Subpart K, Section245.1120]

* protecting water resources. The presumption of water pollution should extend to the full range of chemicals used in the fracking process, and not be arbitrarily limited to select "indicator chemicals". [Subpart F, Section 245.620]

* defining threshold questions. Use of foams and gases in base fluids reduce the total gallons of fluid used in the fracking process, which will limit the number of fracking operations to which the law applies. Multipliers for foams and gases in base fluids must be identified so operators are not able to skirt the law by staying under minimum thresholds. [Subpart A, Section 245.110]

* requiring all high volume hydraulic fracturing operations to be subject to the law. We cannot allow operations that engage in HVHF to be exempt because they started prior to the adoption of the regulatory act. [Subpart A, Section 245.110]

* protecting public participation. Prevent companies from avoiding the public input process by amending their original applications; require significant permit modifications to be subject to the entire public process. [Subpart C, Section 245.330]

Dear Mool,

Laws and regulations are never going to make fracking safe. However, failure to adopt rules that reflect the baseline protections identified in the Hydraulic Fracturing Regulatory Act puts our drinking water and communities at greater risk.

Strengthen the rules by:

* clarifying chemical disclosure for first responders and medical emergencies. Medical professionals and first responders must be able to access chemical information on a 24-7 basis. [Subpart G, Section 245.730]

* eliminating potential abuse of emergency pits. First, require that drillers anticipate appropriate sized tanks for sufficient storage of flowback and produced water. Second, clarify that wastewater must be removed from the pit within 7 days of the event that triggered the use of the pit rather than 7 days after fracking operations are complete, in accordance with the law. [Subpart H, Sections 245.830 245.850]

* increasing administrative and operational penalties. Failure to comply with the law should not be a cost of doing business, increase the fines to discourage non-compliance. [Subpart K, Section245.1120]

* protecting water resources. The presumption of water pollution should extend to the full range of chemicals used in the fracking process, and not be arbitrarily limited to select "indicator chemicals". [Subpart F, Section 245.620]

* defining threshold questions. Use of foams and gases in base fluids reduce the total gallons of fluid used in the fracking process, which will limit the number of fracking operations to which the law applies. Multipliers for foams and gases in base fluids must be identified so operators are not able to skirt the law by staying under minimum thresholds. [Subpart A, Section 245.110]

* requiring all high volume hydraulic fracturing operations to be subject to the law. We cannot allow operations that engage in HVHF to be exempt because they started prior to the adoption of the regulatory act. [Subpart A, Section 245.110]

* protecting public participation. Prevent companies from avoiding the public input process by amending their original applications; require significant permit modifications to be subject to the entire public process. [Subpart C, Section 245.330]

The Hydraulic Fracturing Regulatory Act is a regulatory floor, and in no way makes high-volume hydraulic fracturing safe. The rules developed to better define the Act were to be the foundation to establish baseline minimum protections. Unfortunately the rules developed do not reflect the law that was passed.

I urge you to update the regulations to reflect the law.

Sincerely,

Donald Rosentreter

Use of foams and gases in base fluids reduce the total gallons of fluid used in the fracking process, which will limit the number of fracking operations to which the law applies. Multipliers for foams and gases in base fluids must be identified so operators are not able to skirt the law by staying under minimum thresholds. [Subpart A, Section 245.110]

* requiring all high volume hydraulic fracturing operations to be subject to the law. We cannot allow operations that engage in HVHF to be exempt because they started prior to the adoption of the regulatory act. [Subpart A, Section 245.110]

* protecting public participation. Prevent companies from avoiding the public input process by amending their original applications; require significant permit modifications to be subject to the entire public process. [Subpart C, Section 245.330]

The Hydraulic Fracturing Regulatory Act is a regulatory floor, and in no way makes high-volume hydraulic fracturing safe. The rules developed to better define the Act were to be the foundation to establish baseline minimum protections. Unfortunately the rules developed do not reflect the law that was passed.

I urge you to update the regulations to reflect the law.

Dear Mool,

Laws and regulations are never going to make fracking safe. However, failure to adopt rules that reflect the baseline protections identified in the Hydraulic Fracturing Regulatory Act puts our drinking water and communities at greater risk.

Strengthen the rules by:

* clarifying chemical disclosure for first responders and medical emergencies. Medical professionals and first responders must be able to access chemical information on a 24-7 basis. [Subpart G, Section 245.730]

* eliminating potential abuse of emergency pits. First, require that drillers anticipate appropriate sized tanks for sufficient storage of flowback and produced water. Second, clarify that wastewater must be removed from the pit within 7 days of the event that triggered the use of the pit rather than 7 days after fracking operations are complete, in accordance with the law. [Subpart H, Sections 245.830 245.850]

* increasing administrative and operational penalties. Failure to comply with the law should not be a cost of doing business, increase the fines to discourage non-compliance. [Subpart K, Section245.1120]

* protecting water resources. The presumption of water pollution should extend to the full range of chemicals used in the fracking process, and not be arbitrarily limited to select "indicator chemicals". [Subpart F, Section 245.620]

* defining threshold questions. Use of foams and gases in base fluids reduce the total gallons of fluid used in the fracking process, which will limit the number of fracking operations to which the law applies. Multipliers for foams and gases in base fluids must be identified so operators are not able to skirt the law by staying under minimum thresholds. [Subpart A, Section 245.110]

* requiring all high volume hydraulic fracturing operations to be subject to the law. We cannot allow operations that engage in HVHF to be exempt because they started prior to the adoption of the regulatory act. [Subpart A, Section 245.110]

* protecting public participation. Prevent companies from avoiding the public input process by amending their original applications; require significant permit modifications to be subject to the entire public process. [Subpart C, Section 245.330]

The Hydraulic Fracturing Regulatory Act is a regulatory floor, and in no way makes high-volume hydraulic fracturing safe. Dear Mool,

Laws and regulations are never going to make fracking safe. However, failure to adopt rules that reflect the baseline protections identified in the Hydraulic Fracturing Regulatory Act puts our drinking water and communities at greater risk.

Strengthen the rules by:

* clarifying chemical disclosure for first responders and medical emergencies. Medical professionals and first responders must be able to access chemical information on a 24-7 basis. [Subpart G, Section 245.730]

* eliminating potential abuse of emergency pits. First, require that drillers anticipate appropriate sized tanks for sufficient storage of flowback and produced water. Second, clarify that wastewater must be removed from the pit within 7 days of the event that triggered the use of the pit rather than 7 days after fracking operations are complete, in accordance with the law. [Subpart H, Sections 245.830  245.850]

* increasing administrative and operational penalties. Failure to comply with the law should not be a cost of doing business, increase the fines to discourage non-compliance. [Subpart K, Section245.1120]

* protecting water resources. The presumption of water pollution should extend to the full range of chemicals used in the fracking process, and not be arbitrarily limited to select "indicator chemicals".

[Subpart F, Section 245.620]

* defining threshold questions. Use of foams and gases in base fluids reduce the total gallons of fluid used in the fracking process, which will limit the number of fracking operations to which the law applies. Multipliers for foams and gases in base fluids must be identified so operators are not able to skirt the law by staying under minimum thresholds. [Subpart A, Section 245.110]

* requiring all high volume hydraulic fracturing operations to be subject to the law. We cannot allow operations that engage in HVHF to be exempt because they started prior to the adoption of the regulatory act. [Subpart A, Section 245.110]

* protecting public participation. Prevent companies from avoiding the public input process by amending their original applications; require significant permit modifications to be subject to the entire public process. [Subpart C, Section 245.330]

The Hydraulic Fracturing Regulatory Act is a regulatory floor, and in no way makes high-volume hydraulic fracturing safe. The rules developed to better define the Act were to be the foundation to establish baseline minimum protections. Unfortunately the rules developed do not reflect the law that was passed.

I urge you to update the regulations to reflect the law.

Sincerely,

Kathleen Hollingsworth

* defining threshold questions. Use of foams and gases in base fluids reduce the total gallons of fluid used in the fracking process, which will limit the number of fracking operations to which the law applies. Multipliers for foams and gases in base fluids must be identified so operators are not able to skirt the law by staying under minimum thresholds. [Subpart A, Section 245.110]

* requiring all high volume hydraulic fracturing operations to be subject to the law. We cannot allow operations that engage in HVHF to be exempt because they started prior to the adoption of the regulatory act. [Subpart A, Section 245.110]

* protecting public participation. Prevent companies from avoiding the public input process by amending their original applications; require significant permit modifications to be subject to the entire public process. [Subpart C, Section 245.330]

The Hydraulic Fracturing Regulatory Act is a regulatory floor, and in no way makes high-volume hydraulic fracturing safe. The rules developed to better define the Act were to be the foundation to establish baseline minimum protections. Unfortunately the rules developed do not reflect the law that was passed.

I urge you to update the regulations to reflect the law.

Sincerely,

Dave Sum

Dear Mool,

Laws and regulations are never going to make fracking safe. However, failure to adopt rules that reflect the baseline protections identified in the Hydraulic Fracturing Regulatory Act puts our drinking water and

communities at greater risk.

Strengthen the rules by:

* clarifying chemical disclosure for first responders and medical emergencies. Medical professionals and first responders must be able to access chemical information on a 24-7 basis. [Subpart G, Section 245.730]

* eliminating potential abuse of emergency pits. First, require that drillers anticipate appropriate sized tanks for sufficient storage of flowback and produced water. Second, clarify that wastewater must be removed from the pit within 7 days of the event that triggered the use of the pit rather than 7 days after fracking operations are complete, in accordance with the law. [Subpart H, Sections 245.830  245.850]

* increasing administrative and operational penalties. Failure to comply with the law should not be a cost of doing business, increase the fines to discourage non-compliance. [Subpart K, Section245.1120]

* protecting water resources. The presumption of water pollution should extend to the full range of chemicals used in the fracking process, and not be arbitrarily limited to select "indicator chemicals". [Subpart F, Section 245.620]

* defining threshold questions. Use of foams and gases in base fluids reduce the total gallons of fluid used in the fracking process, which will limit the number of fracking operations to which the law applies. Multipliers for foams and gases in base fluids must be identified so operators are not able to skirt the law by staying under minimum thresholds. [Subpart A, Section 245.110]

* requiring all high volume hydraulic fracturing operations to be subject to the law. We cannot allow operations that engage in HVHF to be exempt because they started prior to the adoption of the regulatory act. [Subpart A, Section 245.110]

*  protecting public participation. Prevent companies from avoiding the public input process by amending their original applications; require significant permit modifications to be subject to the entire public process. [Subpart C, Section 245.330]

IL

Dear Mool,

Laws and regulations are never going to make fracking safe. However, failure to adopt rules that reflect the baseline protections identified in the Hydraulic Fracturing Regulatory Act puts our drinking water and communities at greater risk.

Strengthen the rules by:

* clarifying chemical disclosure for first responders and medical emergencies. Medical professionals and first responders must be able to access chemical information on a 24-7 basis. [Subpart G, Section 245.730]

* eliminating potential abuse of emergency pits. First, require that drillers anticipate appropriate sized tanks for sufficient storage of flowback and produced water. Second, clarify that wastewater must be removed from the pit within 7 days of the event that triggered the use of the pit rather than 7 days after fracking operations are complete, in accordance with the law. [Subpart H, Sections 245.830 245.850]

* increasing administrative and operational penalties. Failure to comply with the law should not be a cost of doing business, increase the fines to discourage non-compliance. [Subpart K, Section245.1120]

* protecting water resources. The presumption of water pollution should extend to the full range of chemicals used in the fracking process, and not be arbitrarily limited to select "indicator chemicals". [Subpart F, Section 245.620]

* defining threshold questions. Use of foams and gases in base fluids reduce the total gallons of fluid used in the fracking process, which will limit the number of fracking operations to which the law applies. Multipliers for foams and gases in base fluids must be identified so operators are not able to skirt the law by staying under minimum thresholds. [Subpart A, Section 245.110]

* requiring all high volume hydraulic fracturing operations to be subject to the law. We cannot allow operations that engage in HVHF to be exempt because they started prior to the adoption of the regulatory act. [Subpart A, Section 245.110]

* protecting public participation. Prevent companies from avoiding the public input process by amending their original applications; require significant permit modifications to be subject to the entire public process. [Subpart C, Section 245.330]

The Hydraulic Fracturing Regulatory Act is a regulatory floor, and in no way makes high-volume hydraulic fracturing safe. The rules developed to better define the Act were to be the foundation to establish baseline minimum protections. Unfortunately the rules developed do not reflect the law that was passed.

I urge you to update the regulations to reflect the law.

Sincerely,

Richard Scoles

Use of foams and gases in base fluids reduce the total gallons of fluid used in the fracking process, which will limit the number of fracking operations to which the law applies. Multipliers for foams and gases in base fluids must be identified so operators are not able to skirt the law by staying under minimum thresholds. [Subpart A, Section 245.110]

* requiring all high volume hydraulic fracturing operations to be subject to the law. We cannot allow operations that engage in HVHF to be exempt because they started prior to the adoption of the regulatory act. [Subpart A, Section 245.110]

* protecting public participation. Prevent companies from avoiding the public input process by amending their original applications; require significant permit modifications to be subject to the entire public process. [Subpart C, Section 245.330]

The Hydraulic Fracturing Regulatory Act is a regulatory floor, and in no way makes high-volume hydraulic fracturing safe. The rules developed to better define the Act were to be the foundation to establish baseline minimum protections. Unfortunately the rules developed do not reflect the law that was passed.

I urge you to update the regulations to reflect the law.

Sincerely,

Mark & Deborah Novak

Dear Mool,

Laws and regulations are never going to make fracking safe. However, failure to adopt rules that reflect the baseline protections identified in the Hydraulic Fracturing Regulatory Act puts our drinking water and communities at greater risk.

Strengthen the rules by:

* clarifying chemical disclosure for first responders and medical emergencies. Medical professionals and first responders must be able to access chemical information on a 24-7 basis. [Subpart G, Section 245.730]

* eliminating potential abuse of emergency pits. First, require that drillers anticipate appropriate sized tanks for sufficient storage of flowback and produced water. Second, clarify that wastewater must be removed from the pit within 7 days of the event that triggered the use of the pit rather than 7 days after fracking operations are complete, in accordance with the law. [Subpart H, Sections 245.830 245.850]

* increasing administrative and operational penalties. Failure to comply with the law should not be a cost of doing business, increase the fines to discourage non-compliance. [Subpart K, Section245.1120]

* protecting water resources. The presumption of water pollution should extend to the full range of chemicals used in the fracking process, and not be arbitrarily limited to select "indicator chemicals". [Subpart F, Section 245.620]

* defining threshold questions. Use of foams and gases in base fluids reduce the total gallons of fluid used in the fracking process, which will limit the number of fracking operations to which the law applies. Multipliers for foams and gases in base fluids must be identified so operators are not able to skirt the law by staying under minimum

thresholds. [Subpart A, Section 245.110]

* requiring all high volume hydraulic fracturing operations to be subject to the law. We cannot allow operations that engage in HVHF to be exempt because they started prior to the adoption of the regulatory act. [Subpart A, Section 245.110]

* protecting public participation. Prevent companies from avoiding the public input process by amending their original applications; require significant permit modifications to be subject to the entire public process. [Subpart C, Section 245.330]

Dear Mool,

Laws and regulations are never going to make fracking safe. However, failure to adopt rules that reflect the baseline protections identified in the Hydraulic Fracturing Regulatory Act puts our drinking water and communities at greater risk.

Strengthen the rules by:

* clarifying chemical disclosure for first responders and medical emergencies. Medical professionals and first responders must be able to access chemical information on a 24-7 basis. [Subpart G, Section 245.730]

* eliminating potential abuse of emergency pits. First, require that drillers anticipate appropriate sized tanks for sufficient storage of flowback and produced water. Second, clarify that wastewater must be removed from the pit within 7 days of the event that triggered the use of the pit rather than 7 days after fracking operations are complete, in accordance with the law. [Subpart H, Sections 245.830 245.850]

* increasing administrative and operational penalties. Failure to comply with the law should not be a cost of doing business, increase the fines to discourage non-compliance. [Subpart K, Section245.1120]

* protecting water resources. The presumption of water pollution should extend to the full range of chemicals used in the fracking process, and not be arbitrarily limited to select "indicator chemicals". [Subpart F, Section 245.620]

* defining threshold questions. Use of foams and gases in base fluids

reduce the total gallons of fluid used in the fracking process, which will limit the number of fracking operations to which the law applies. Multipliers for foams and gases in base fluids must be identified so operators are not able to skirt the law by staying under minimum thresholds. [Subpart A, Section 245.110]

* requiring all high volume hydraulic fracturing operations to be subject to the law. We cannot allow operations that engage in HVHF to be exempt because they started prior to the adoption of the regulatory act. [Subpart A, Section 245.110]

* protecting public participation. Prevent companies from avoiding the public input process by amending their original applications; require significant permit modifications to be subject to the entire public process. [Subpart C, Section 245.330]

The Hydraulic Fracturing Regulatory Act is a regulatory floor, and in no way makes high-volume hydraulic fracturing safe. The rules developed to better define the Act were to be the foundation to establish baseline minimum protections. Unfortunately the rules developed do not reflect the law that was passed.

I urge you to update the regulations to reflect the law.

Sincerely,

David Rechs

[Subpart H, Sections 245.830 245.850]

* increasing administrative and operational penalties. Failure to comply with the law should not be a cost of doing business, increase the fines to discourage non-compliance. [Subpart K, Section245.1120]

* protecting water resources. The presumption of water pollution should extend to the full range of chemicals used in the fracking process, and not be arbitrarily limited to select "indicator chemicals". [Subpart F, Section 245.620]

* defining threshold questions. Use of foams and gases in base fluids reduce the total gallons of fluid used in the fracking process, which will limit the number of fracking operations to which the law applies. Multipliers for foams and gases in base fluids must be identified so operators are not able to skirt the law by staying under minimum thresholds. [Subpart A, Section 245.110]

* requiring all high volume hydraulic fracturing operations to be subject to the law. We cannot allow operations that engage in HVHF to be exempt because they started prior to the adoption of the regulatory act. [Subpart A, Section 245.110]

* protecting public participation. Prevent companies from avoiding the public input process by amending their original applications; require significant permit modifications to be subject to the entire public process. [Subpart C, Section 245.330]

The Hydraulic Fracturing Regulatory Act is a regulatory floor, and in no way makes high-volume hydraulic fracturing safe. The rules developed to better define the Act were to be the foundation to establish baseline minimum protections. Unfortunately the rules developed do not reflect the law that was passed.

I urge you to update the regulations to reflect the law.

Sincerely,

V Voland

Dear Mool,

Laws and regulations are never going to make fracking safe. However, failure to adopt rules that reflect the baseline protections identified in the Hydraulic Fracturing Regulatory Act puts our drinking water and communities at greater risk.

Strengthen the rules by:

* clarifying chemical disclosure for first responders and medical emergencies. Medical professionals and first responders must be able to access chemical information on a 24-7 basis. [Subpart G, Section 245.730]

* eliminating potential abuse of emergency pits. First, require that drillers anticipate appropriate sized tanks for sufficient storage of flowback and produced water. Second, clarify that wastewater must be removed from the pit within 7 days of the event that triggered the use of the pit rather than 7 days after fracking operations are complete, in accordance with the law. [Subpart H, Sections 245.830 245.850]

* increasing administrative and operational penalties. Failure to comply with the law should not be a cost of doing business, increase the fines to discourage non-compliance. [Subpart K, Section245.1120]

* protecting water resources. The presumption of water pollution should extend to the full range of chemicals used in the fracking process, and not be arbitrarily limited to select "indicator chemicals". [Subpart F, Section 245.620]

* defining threshold questions. Use of foams and gases in base fluids reduce the total gallons of fluid used in the fracking process, which will limit the number of fracking operations to which the law applies. Multipliers for foams and gases in base fluids must be identified so operators are not able to skirt the law by staying under minimum thresholds. [Subpart A, Section 245.110]

* requiring all high volume hydraulic fracturing operations to be subject to the law. We cannot allow operations that engage in HVHF to be exempt because they started prior to the adoption of the regulatory act. [Subpart A, Section 245.110]

Dear Mool,

Laws and regulations are never going to make fracking safe. However, failure to adopt rules that reflect the baseline protections identified in the Hydraulic Fracturing Regulatory Act puts our drinking water and communities at greater risk.

Strengthen the rules by:

* clarifying chemical disclosure for first responders and medical emergencies. Medical professionals and first responders must be able to access chemical information on a 24-7 basis. [Subpart G, Section 245.730]

* eliminating potential abuse of emergency pits. First, require that drillers anticipate appropriate sized tanks for sufficient storage of flowback and produced water. Second, clarify that wastewater must be removed from the pit within 7 days of the event that triggered the use of the pit rather than 7 days after fracking operations are complete, in accordance with the law. [Subpart H, Sections 245.830 245.850]

* increasing administrative and operational penalties. Failure to comply with the law should not be a cost of doing business, increase the fines to discourage non-compliance. [Subpart K, Section245.1120]

* protecting water resources. The presumption of water pollution should extend to the full range of chemicals used in the fracking process, and not be arbitrarily limited to select "indicator chemicals". [Subpart F, Section 245.620]

* defining threshold questions. Use of foams and gases in base fluids reduce the total gallons of fluid used in the fracking process, which will limit the number of fracking operations to which the law applies. Multipliers for foams and gases in base fluids must be identified so operators are not able to skirt the law by staying under minimum thresholds. [Subpart A, Section 245.110]

* requiring all high volume hydraulic fracturing operations to be subject to the law. We cannot allow operations that engage in HVHF to be exempt because they started prior to the adoption of the regulatory act. [Subpart A, Section 245.110]

* protecting public participation. Prevent companies from avoiding the public input process by amending their original applications; require significant permit modifications to be subject to the entire public process. [Subpart C, Section 245.330]

The Hydraulic Fracturing Regulatory Act is a regulatory floor, and in no way makes high-volume hydraulic fracturing safe. The rules developed to better define the Act were to be the foundation to establish baseline minimum protections. Unfortunately the rules developed do not reflect the law that was passed.

I urge you to update the regulations to reflect the law.

Sincerely,

Georgia Gebhardt

[Subpart H, Sections 245.830 245.850]

* increasing administrative and operational penalties. Failure to comply with the law should not be a cost of doing business, increase the fines to discourage non-compliance. [Subpart K, Section245.1120]

* protecting water resources. The presumption of water pollution should extend to the full range of chemicals used in the fracking process, and not be arbitrarily limited to select "indicator chemicals". [Subpart F, Section 245.620]

* defining threshold questions. Use of foams and gases in base fluids reduce the total gallons of fluid used in the fracking process, which will limit the number of fracking operations to which the law applies. Multipliers for foams and gases in base fluids must be identified so operators are not able to skirt the law by staying under minimum thresholds. [Subpart A, Section 245.110]

* requiring all high volume hydraulic fracturing operations to be subject to the law. We cannot allow operations that engage in HVHF to be exempt because they started prior to the adoption of the regulatory act. [Subpart A, Section 245.110]

* protecting public participation. Prevent companies from avoiding the public input process by amending their original applications; require significant permit modifications to be subject to the entire public process. [Subpart C, Section 245.330]

The Hydraulic Fracturing Regulatory Act is a regulatory floor, and in no way makes high-volume hydraulic fracturing safe. The rules developed to better define the Act were to be the foundation to establish baseline minimum protections. Unfortunately the rules developed do not

618968

reflect the law that was passed.

I urge you to update the regulations to reflect the law.

Sincerely,

Joe Coco

Dear Mool,

Laws and regulations are never going to make fracking safe. However, failure to adopt rules that reflect the baseline protections identified in the Hydraulic Fracturing Regulatory Act puts our drinking water and communities at greater risk.

Strengthen the rules by:

* clarifying chemical disclosure for first responders and medical emergencies. Medical professionals and first responders must be able to access chemical information on a 24-7 basis. [Subpart G, Section 245.730]

* eliminating potential abuse of emergency pits. First, require that drillers anticipate appropriate sized tanks for sufficient storage of flowback and produced water. Second, clarify that wastewater must be removed from the pit within 7 days of the event that triggered the use of the pit rather than 7 days after fracking operations are complete, in accordance with the law. [Subpart H, Sections 245.830 245.850]

* increasing administrative and operational penalties. Failure to comply with the law should not be a cost of doing business, increase the fines to discourage non-compliance. [Subpart K, Section245.1120]

* protecting water resources. The presumption of water pollution should

extend to the full range of chemicals used in the fracking process, and not be arbitrarily limited to select "indicator chemicals". [Subpart F, Section 245.620]

* defining threshold questions. Use of foams and gases in base fluids reduce the total gallons of fluid used in the fracking process, which will limit the number of fracking operations to which the law applies. Multipliers for foams and gases in base fluids must be identified so operators are not able to skirt the law by staying under minimum thresholds. [Subpart A, Section 245.110]

* requiring all high volume hydraulic fracturing operations to be subject to the law. We cannot allow operations that engage in HVHF to be exempt because they started prior to the adoption of the regulatory act. [Subpart A, Section 245.110]

* protecting public participation. Prevent companies from avoiding the public input process by amending their original applications; require significant permit modifications to be subject to the entire public process. [Subpart C, Section 245.330]

IL

Dear Mool,

Laws and regulations are never going to make fracking safe. However, failure to adopt rules that reflect the baseline protections identified in the Hydraulic Fracturing Regulatory Act puts our drinking water and communities at greater risk.

Strengthen the rules by:

* clarifying chemical disclosure for first responders and medical emergencies. Medical professionals and first responders must be able to access chemical information on a 24-7 basis. [Subpart G, Section 245.730]

* eliminating potential abuse of emergency pits. First, require that drillers anticipate appropriate sized tanks for sufficient storage of flowback and produced water. Second, clarify that wastewater must be removed from the pit within 7 days of the event that triggered the use of the pit rather than 7 days after fracking operations are complete, in accordance with the law. [Subpart H, Sections 245.830 245.850]

* increasing administrative and operational penalties. Failure to

comply with the law should not be a cost of doing business, increase the fines to discourage non-compliance. [Subpart K, Section245.1120]

* protecting water resources. The presumption of water pollution should extend to the full range of chemicals used in the fracking process, and not be arbitrarily limited to select "indicator chemicals". [Subpart F, Section 245.620]

* defining threshold questions. Use of foams and gases in base fluids reduce the total gallons of fluid used in the fracking process, which will limit the number of fracking operations to which the law applies. Multipliers for foams and gases in base fluids must be identified so operators are not able to skirt the law by staying under minimum thresholds. [Subpart A, Section 245.110]

* requiring all high volume hydraulic fracturing operations to be subject to the law. We cannot allow operations that engage in HVHF to be exempt because they started prior to the adoption of the regulatory act. [Subpart A, Section 245.110]

* protecting public participation. Prevent companies from avoiding the public input process by amending their original applications; require significant permit modifications to be subject to the entire public process. [Subpart C, Section 245.330]

The Hydraulic Fracturing Regulatory Act is a regulatory floor, and in no way makes high-volume hydraulic fracturing safe. The rules developed to better define the Act were to be the foundation to establish baseline minimum protections. Unfortunately the rules developed do not reflect the law that was passed.

I urge you to update the regulations to reflect the law.

Dear Mool,

The Hydraulic Fracturing Regulatory Act is a regulatory floor, and in no way makes high-volume hydraulic fracturing safe. The rules developed to better define the Act were to be the foundation to establish baseline minimum protections. Unfortunately the rules developed do not reflect the law that was passed, and until strengthened will not provide baseline protections intended. Strengthen the rules by:

* clarifying chemical disclosure for first responders and medical emergencies. Medical professionals and first responders must be able to access chemical information on a 24-7 basis. [Subpart G, Section 245.730]

* eliminating potential abuse of emergency pits. First, require that drillers anticipate appropriate sized tanks for sufficient storage of flowback and produced water. Second, clarify that wastewater must be removed from the pit within 7 days of the event that triggered the use of the pit rather than 7 days after fracking operations are complete, in accordance with the law. [Subpart H, Sections 245.830 245.850]

* increasing administrative and operational penalties. Failure to comply with the law should not be a cost of doing business, increase the fines to discourage non-compliance. [Subpart K, Section245.1120]

* protecting water resources. The presumption of water pollution should extend to the full range of chemicals used in the fracking process, and not be arbitrarily limited to select "indicator chemicals". [Subpart F, Section 245.620]

* defining threshold questions. Use of foams and gases in base fluids reduce the total gallons of fluid used in the fracking process, which will limit the number of fracking operations to which the law applies. Multipliers for foams and gases in base fluids must be identified so operators are not able to skirt the law by staying under minimum thresholds. [Subpart A, Section 245.110]

* requiring all high volume hydraulic fracturing operations to be subject to the law. We cannot allow operations that engage in HVHF to be exempt because they started prior to the adoption of the regulatory act. [Subpart A, Section 245.110]

* protecting public participation. Prevent companies from avoiding the public input process by amending their original applications; require significant permit modifications to be subject to the entire public process. [Subpart C, Section 245.330]

Laws and regulations are never going to make fracking safe. However, failure to adopt rules that reflect the baseline protections identified in the Hydraulic Fracturing Regulatory Act puts our drinking water and communities at greater risk.

* eliminating potential abuse of emergency pits. First, require that drillers anticipate appropriate sized tanks for sufficient storage of flowback and produced water. Second, clarify that wastewater must be removed from the pit within 7 days of the event that triggered the use of the pit rather than 7 days after fracking operations are complete, in accordance with the law. [Subpart H, Sections 245.830  245.850]

* increasing administrative and operational penalties. Failure to comply with the law should not be a cost of doing business, increase the fines to discourage non-compliance. [Subpart K, Section245.1120]

* protecting water resources. The presumption of water pollution should extend to the full range of chemicals used in the fracking process, and not be arbitrarily limited to select "indicator chemicals". [Subpart F, Section 245.620]

* defining threshold questions. Use of foams and gases in base fluids reduce the total gallons of fluid used in the fracking process, which will limit the number of fracking operations to which the law applies. Multipliers for foams and gases in base fluids must be identified so operators are not able to skirt the law by staying under minimum thresholds. [Subpart A, Section 245.110]

* requiring all high volume hydraulic fracturing operations to be subject to the law. We cannot allow operations that engage in HVHF to be exempt because they started prior to the adoption of the regulatory act. [Subpart A, Section 245.110]

* protecting public participation. Prevent companies from avoiding the public input process by amending their original applications; require significant permit modifications to be subject to the entire public process. [Subpart C, Section 245.330]

The Hydraulic Fracturing Regulatory Act is a regulatory floor, and in no way makes high-volume hydraulic fracturing safe. The rules developed to better define the Act were to be the foundation to establish baseline minimum protections. Unfortunately the rules developed do not reflect the law that was passed.

I urge you to update the regulations to reflect the law.

Sincerely,

Dean Woelfle

Dear Mool,

Laws and regulations are never going to make fracking safe. However, failure to adopt rules that reflect the baseline protections identified in the Hydraulic Fracturing Regulatory Act puts our drinking water and communities at greater risk.

Strengthen the rules by:

* clarifying chemical disclosure for first responders and medical emergencies. Medical professionals and first responders must be able to access chemical information on a 24-7 basis. [Subpart G, Section 245.730]

* eliminating potential abuse of emergency pits. First, require that drillers anticipate appropriate sized tanks for sufficient storage of flowback and produced water. Second, clarify that wastewater must be removed from the pit within 7 days of the event that triggered the use of the pit rather than 7 days after fracking operations are complete, in accordance with the law. [Subpart H, Sections 245.830 245.850]

* increasing administrative and operational penalties. Failure to comply with the law should not be a cost of doing business, increase the fines to discourage non-compliance. [Subpart K, Section245.1120]

* protecting water resources. The presumption of water pollution should extend to the full range of chemicals used in the fracking process, and not be arbitrarily limited to select "indicator chemicals". [Subpart F, Section 245.620]

* defining threshold questions. Use of foams and gases in base fluids reduce the total gallons of fluid used in the fracking process, which will limit the number of fracking operations to which the law applies. Multipliers for foams and gases in base fluids must be identified so operators are not able to skirt the law by staying under minimum thresholds. [Subpart A, Section 245.110]

Dear Mool,

Laws and regulations are never going to make fracking safe. However, failure to adopt rules that reflect the baseline protections identified in the Hydraulic Fracturing Regulatory Act puts our drinking water and communities at greater risk.

Strengthen the rules by:

* clarifying chemical disclosure for first responders and medical emergencies. Medical professionals and first responders must be able to access chemical information on a 24-7 basis. [Subpart G, Section 245.730]

* eliminating potential abuse of emergency pits. First, require that drillers anticipate appropriate sized tanks for sufficient storage of flowback and produced water. Second, clarify that wastewater must be removed from the pit within 7 days of the event that triggered the use of the pit rather than 7 days after fracking operations are complete, in accordance with the law. [Subpart H, Sections 245.830 245.850]

* increasing administrative and operational penalties. Failure to comply with the law should not be a cost of doing business, increase the fines to discourage non-compliance. [Subpart K, Section245.1120]

* protecting water resources. The presumption of water pollution should extend to the full range of chemicals used in the fracking process, and not be arbitrarily limited to select "indicator chemicals". [Subpart F, Section 245.620]

* defining threshold questions. Use of foams and gases in base fluids reduce the total gallons of fluid used in the fracking process, which will limit the number of fracking operations to which the law applies. Multipliers for foams and gases in base fluids must be identified so operators are not able to skirt the law by staying under minimum thresholds. [Subpart A, Section 245.110]

* requiring all high volume hydraulic fracturing operations to be subject to the law. We cannot allow operations that engage in HVHF to be exempt because they started prior to the adoption of the regulatory act. [Subpart A, Section 245.110]

* protecting public participation. Prevent companies from avoiding the public input process by amending their original applications; require significant permit modifications to be subject to the entire public process. [Subpart C, Section 245.330]

Dear Mool,

Laws and regulations are never going to make fracking safe. However, failure to adopt rules that reflect the baseline protections identified in the Hydraulic Fracturing Regulatory Act puts our drinking water and communities at greater risk.

Strengthen the rules by:

* clarifying chemical disclosure for first responders and medical emergencies. Medical professionals and first responders must be able to access chemical information on a 24-7 basis. [Subpart G, Section 245.730]

* eliminating potential abuse of emergency pits. First, require that drillers anticipate appropriate sized tanks for sufficient storage of flowback and produced water. Second, clarify that wastewater must be removed from the pit within 7 days of the event that triggered the use of the pit rather than 7 days after fracking operations are complete, in accordance with the law. [Subpart H, Sections 245.830 245.850]

* increasing administrative and operational penalties. Failure to comply with the law should not be a cost of doing business, increase the fines to discourage non-compliance. [Subpart K, Section245.1120]

* protecting water resources. The presumption of water pollution should extend to the full range of chemicals used in the fracking process, and not be arbitrarily limited to select "indicator chemicals". [Subpart F, Section 245.620]

* defining threshold questions. Use of foams and gases in base fluids reduce the total gallons of fluid used in the fracking process, which will limit the number of fracking operations to which the law applies. Multipliers for foams and gases in base fluids must be identified so operators are not able to skirt the law by staying under minimum thresholds. [Subpart A, Section 245.110]

* requiring all high volume hydraulic fracturing operations to be subject to the law. We cannot allow operations that engage in HVHF to be exempt because they started prior to the adoption of the regulatory act. [Subpart A, Section 245.110]

* protecting public participation. Prevent companies from avoiding the public input process by amending their original applications; require significant permit modifications to be subject to the entire public process. [Subpart C, Section 245.330]

618975

The Hydraulic Fracturing Regulatory Act is a regulatory floor, and in no way makes high-volume hydraulic fracturing safe. The rules developed to better define the Act were to be the foundation to establish baseline minimum protections. Unfortunately the rules developed do not reflect the law that was passed.

I urge you to update the regulations to reflect the law.

Sincerely,

Clifford Rot

Dear Mool,

The Hydraulic Fracturing Regulatory Act is a regulatory floor, and in no way makes high-volume hydraulic fracturing safe. The rules developed to better define the Act were to be the foundation to establish baseline minimum protections. Unfortunately the rules developed do not reflect the law that was passed, and until strengthened will not provide baseline protections intended. Strengthen the rules by:

* clarifying chemical disclosure for first responders and medical emergencies. Medical professionals and first responders must be able to access chemical information on a 24-7 basis. [Subpart G, Section 245.730]

* eliminating potential abuse of emergency pits. First, require that drillers anticipate appropriate sized tanks for sufficient storage of flowback and produced water. Second, clarify that wastewater must be removed from the pit within 7 days of the event that triggered the use of the pit rather than 7 days after fracking operations are complete, in accordance with the law. [Subpart H, Sections 245.830 245.850]

* increasing administrative and operational penalties. Failure to comply with the law should not be a cost of doing business, increase the fines to discourage non-compliance. [Subpart K, Section245.1120]

* protecting water resources. The presumption of water pollution should extend to the full range of chemicals used in the fracking process, and not be arbitrarily limited to select "indicator chemicals". [Subpart F, Section 245.620]

* defining threshold questions. Use of foams and gases in base fluids reduce the total gallons of fluid used in the fracking process, which will limit the number of fracking operations to which the law applies. Multipliers for foams and gases in base fluids must be identified so operators are not able to skirt the law by staying under minimum thresholds. [Subpart A, Section 245.110]

* requiring all high volume hydraulic fracturing operations to be subject to the law. We cannot allow operations that engage in HVHF to be exempt because they started prior to the adoption of the regulatory act. [Subpart A, Section 245.110]

* protecting public participation. Prevent companies from avoiding the public input process by amending their original applications; require significant permit modifications to be subject to the entire public process. [Subpart C, Section 245.330]

Laws and regulations are never going to make fracking safe. However, failure to adopt rules that reflect the baseline protections identified in the Hydraulic Fracturing Regulatory Act puts our drinking water and communities at greater risk.

* defining threshold questions. Use of foams and gases in base fluids reduce the total gallons of fluid used in the fracking process, which will limit the number of fracking operations to which the law applies. Multipliers for foams and gases in base fluids must be identified so operators are not able to skirt the law by staying under minimum thresholds. [Subpart A, Section 245.110]

* requiring all high volume hydraulic fracturing operations to be subject to the law. We cannot allow operations that engage in HVHF to be exempt because they started prior to the adoption of the regulatory act. [Subpart A, Section 245.110]

* protecting public participation. Prevent companies from avoiding the public input process by amending their original applications; require significant permit modifications to be subject to the entire public process. [Subpart C, Section 245.330]

The Hydraulic Fracturing Regulatory Act is a regulatory floor, and in

618991

no way makes high-volume hydraulic fracturing safe. The rules developed to better define the Act were to be the foundation to establish baseline minimum protections. Unfortunately the rules developed do not reflect the law that was passed.

I urge you to update the regulations to reflect the law.

Sincerely,

Calvin Maginel

Dear Mool,

Laws and regulations are never going to make fracking safe. However, failure to adopt rules that reflect the baseline protections identified in the Hydraulic Fracturing Regulatory Act puts our drinking water and communities at greater risk.

Strengthen the rules by:

* clarifying chemical disclosure for first responders and medical emergencies. Medical professionals and first responders must be able to access chemical information on a 24-7 basis. [Subpart G, Section 245.730]

* eliminating potential abuse of emergency pits. First, require that drillers anticipate appropriate sized tanks for sufficient storage of flowback and produced water. Second, clarify that wastewater must be removed from the pit within 7 days of the event that triggered the use of the pit rather than 7 days after fracking operations are complete, in accordance with the law. [Subpart H, Sections 245.830 245.850]

* increasing administrative and operational penalties. Failure to comply with the law should not be a cost of doing business, increase

the fines to discourage non-compliance. [Subpart K, Section245.1120]

* protecting water resources. The presumption of water pollution should extend to the full range of chemicals used in the fracking process, and not be arbitrarily limited to select "indicator chemicals". [Subpart F, Section 245.620]

* defining threshold questions. Use of foams and gases in base fluids reduce the total gallons of fluid used in the fracking process, which will limit the number of fracking operations to which the law applies. Multipliers for foams and gases in base fluids must be identified so operators are not able to skirt the law by staying under minimum thresholds. [Subpart A, Section 245.110]

* requiring all high volume hydraulic fracturing operations to be subject to the law. We cannot allow operations that engage in HVHF to be exempt because they started prior to the adoption of the regulatory act. [Subpart A, Section 245.110]

* protecting public participation. Prevent companies from avoiding the public input process by amending their original applications; require significant permit modifications to be subject to the entire public process. [Subpart C, Section 245.330]

Dear Mool,

Laws and regulations are never going to make fracking safe. However, failure to adopt rules that reflect the baseline protections identified in the Hydraulic Fracturing Regulatory Act puts our drinking water and communities at greater risk.

Strengthen the rules by:

* clarifying chemical disclosure for first responders and medical emergencies. Medical professionals and first responders must be able to access chemical information on a 24-7 basis. [Subpart G, Section 245.730]

* eliminating potential abuse of emergency pits. First, require that drillers anticipate appropriate sized tanks for sufficient storage of flowback and produced water. Second, clarify that wastewater must be removed from the pit within 7 days of the event that triggered the use of the pit rather than 7 days after fracking operations are complete, in accordance with the law. [Subpart H, Sections 245.830 245.850]

* increasing administrative and operational penalties. Failure to comply with the law should not be a cost of doing business, increase the fines to discourage non-compliance. [Subpart K, Section245.1120]

* protecting water resources. The presumption of water pollution should extend to the full range of chemicals used in the fracking process, and not be arbitrarily limited to select "indicator chemicals". [Subpart F, Section 245.620]

* defining threshold questions. Use of foams and gases in base fluids reduce the total gallons of fluid used in the fracking process, which will limit the number of fracking operations to which the law applies. Multipliers for foams and gases in base fluids must be identified so operators are not able to skirt the law by staying under minimum thresholds. [Subpart A, Section 245.110]

* requiring all high volume hydraulic fracturing operations to be subject to the law. We cannot allow operations that engage in HVHF to be exempt because they started prior to the adoption of the regulatory act. [Subpart A, Section 245.110]

* protecting public participation. Prevent companies from avoiding the public input process by amending their original applications; require significant permit modifications to be subject to the entire public process. [Subpart C, Section 245.330]

The Hydraulic Fracturing Regulatory Act is a regulatory floor, and in no way makes high-volume hydraulic fracturing safe. The rules developed to better define the Act were to be the foundation to establish baseline minimum protections. Unfortunately the rules developed do not reflect the law that was passed.

I urge you to update the regulations to reflect the law.

Sincerely,

Sonja Chan

* defining threshold questions. Use of foams and gases in base fluids reduce the total gallons of fluid used in the fracking process, which will limit the number of fracking operations to which the law applies. Multipliers for foams and gases in base fluids must be identified so operators are not able to skirt the law by staying under minimum thresholds. [Subpart A, Section 245.110]

* requiring all high volume hydraulic fracturing operations to be subject to the law. We cannot allow operations that engage in HVHF to be exempt because they started prior to the adoption of the regulatory act. [Subpart A, Section 245.110]

* protecting public participation. Prevent companies from avoiding the public input process by amending their original applications; require significant permit modifications to be subject to the entire public process. [Subpart C, Section 245.330]

The Hydraulic Fracturing Regulatory Act is a regulatory floor, and in no way makes high-volume hydraulic fracturing safe. The rules developed to better define the Act were to be the foundation to establish baseline minimum protections. Unfortunately the rules developed do not reflect the law that was passed.

I urge you to update the regulations to reflect the law.

Sincerely,

Donna Bierschenk

Dear Mool,

Laws and regulations are never going to make fracking safe. However, failure to adopt rules that reflect the baseline protections identified in the Hydraulic Fracturing Regulatory Act puts our drinking water and communities at greater risk.

Strengthen the rules by:

* clarifying chemical disclosure for first responders and medical emergencies. Medical professionals and first responders must be able to access chemical information on a 24-7 basis. [Subpart G, Section 245.730]

* eliminating potential abuse of emergency pits. First, require that drillers anticipate appropriate sized tanks for sufficient storage of flowback and produced water. Second, clarify that wastewater must be removed from the pit within 7 days of the event that triggered the use of the pit rather than 7 days after fracking operations are complete, in accordance with the law. [Subpart H, Sections 245.830 245.850]

* increasing administrative and operational penalties. Failure to comply with the law should not be a cost of doing business, increase the fines to discourage non-compliance. [Subpart K, Section245.1120]

* protecting water resources. The presumption of water pollution should extend to the full range of chemicals used in the fracking process, and not be arbitrarily limited to select "indicator chemicals". [Subpart F, Section 245.620]

* defining threshold questions. Use of foams and gases in base fluids reduce the total gallons of fluid used in the fracking process, which will limit the number of fracking operations to which the law applies. Multipliers for foams and gases in base fluids must be identified so operators are not able to skirt the law by staying under minimum thresholds. [Subpart A, Section 245.110]

* requiring all high volume hydraulic fracturing operations to be subject to the law. We cannot allow operations that engage in HVHF to be exempt because they started prior to the adoption of the regulatory act. [Subpart A, Section 245.110]

* protecting public participation. Prevent companies from avoiding the public input process by amending their original applications; require significant permit modifications to be subject to the entire public process. [Subpart C, Section 245.330]

IL

Dear Mool,

Laws and regulations are never going to make fracking safe. However, failure to adopt rules that reflect the baseline protections identified in the Hydraulic Fracturing Regulatory Act puts our drinking water and communities at greater risk.

Strengthen the rules by:

* clarifying chemical disclosure for first responders and medical emergencies. Medical professionals and first responders must be able to access chemical information on a 24-7 basis. [Subpart G, Section 245.730]

* eliminating potential abuse of emergency pits. First, require that drillers anticipate appropriate sized tanks for sufficient storage of flowback and produced water. Second, clarify that wastewater must be removed from the pit within 7 days of the event that triggered the use of the pit rather than 7 days after fracking operations are complete, in accordance with the law. [Subpart H, Sections 245.830 245.850]

* increasing administrative and operational penalties. Failure to comply with the law should not be a cost of doing business, increase the fines to discourage non-compliance. [Subpart K, Section245.1120]

* protecting water resources. The presumption of water pollution should extend to the full range of chemicals used in the fracking process, and not be arbitrarily limited to select "indicator chemicals". [Subpart F, Section 245.620]

* defining threshold questions. Use of foams and gases in base fluids reduce the total gallons of fluid used in the fracking process, which will limit the number of fracking operations to which the law applies. Multipliers for foams and gases in base fluids must be identified so operators are not able to skirt the law by staying under minimum thresholds. [Subpart A, Section 245.110]

* requiring all high volume hydraulic fracturing operations to be subject to the law. We cannot allow operations that engage in HVHF to be exempt because they started prior to the adoption of the regulatory act. [Subpart A, Section 245.110]

* protecting public participation. Prevent companies from avoiding the public input process by amending their original applications; require significant permit modifications to be subject to the entire public process. [Subpart C, Section 245.330]

The Hydraulic Fracturing Regulatory Act is a regulatory floor, and in no way makes high-volume hydraulic fracturing safe. The rules developed

to better define the Act were to be the foundation to establish baseline minimum protections. Unfortunately the rules developed do not reflect the law that was passed.

I urge you to update the regulations to reflect the law.

Sincerely,

Joan Mundstock

Use of foams and gases in base fluids reduce the total gallons of fluid used in the fracking process, which will limit the number of fracking operations to which the law applies. Multipliers for foams and gases in base fluids must be identified so operators are not able to skirt the law by staying under minimum thresholds. [Subpart A, Section 245.110]

* requiring all high volume hydraulic fracturing operations to be subject to the law. We cannot allow operations that engage in HVHF to be exempt because they started prior to the adoption of the regulatory act. [Subpart A, Section 245.110]

* protecting public participation. Prevent companies from avoiding the public input process by amending their original applications; require significant permit modifications to be subject to the entire public process. [Subpart C, Section 245.330]

019058

The Hydraulic Fracturing Regulatory Act is a regulatory floor, and in no way makes high-volume hydraulic fracturing safe. The rules developed to better define the Act were to be the foundation to establish baseline minimum protections. Unfortunately the rules developed do not reflect the law that was passed.

I urge you to update the regulations to reflect the law.

Sincerely,

Frederick Bradley

Dear Mool,

Laws and regulations are never going to make fracking safe. However, failure to adopt rules that reflect the baseline protections identified in the Hydraulic Fracturing Regulatory Act puts our drinking water and communities at greater risk.

Strengthen the rules by:

* clarifying chemical disclosure for first responders and medical emergencies. Medical professionals and first responders must be able to access chemical information on a 24-7 basis. [Subpart G, Section 245.730]

* eliminating potential abuse of emergency pits. First, require that drillers anticipate appropriate sized tanks for sufficient storage of flowback and produced water. Second, clarify that wastewater must be removed from the pit within 7 days of the event that triggered the use of the pit rather than 7 days after fracking operations are complete, in accordance with the law. [Subpart H, Sections 245.830 245.850]

* increasing administrative and operational penalties. Failure to

comply with the law should not be a cost of doing business, increase the fines to discourage non-compliance. [Subpart K, Section245.1120]

* protecting water resources. The presumption of water pollution should extend to the full range of chemicals used in the fracking process, and not be arbitrarily limited to select "indicator chemicals". [Subpart F, Section 245.620]

* defining threshold questions. Use of foams and gases in base fluids reduce the total gallons of fluid used in the fracking process, which will limit the number of fracking operations to which the law applies. Multipliers for foams and gases in base fluids must be identified so operators are not able to skirt the law by staying under minimum thresholds. [Subpart A, Section 245.110]

* requiring all high volume hydraulic fracturing operations to be subject to the law. We cannot allow operations that engage in HVHF to be exempt because they started prior to the adoption of the regulatory act. [Subpart A, Section 245.110]

* protecting public participation. Prevent companies from avoiding the public input process by amending their original applications; require significant permit modifications to be subject to the entire public process. [Subpart C, Section 245.330]

Dear Mool,

The Hydraulic Fracturing Regulatory Act is a regulatory floor, and in no way makes high-volume hydraulic fracturing safe. The rules developed to better define the Act were to be the foundation to establish baseline minimum protections. Unfortunately the rules developed do not reflect the law that was passed, and until strengthened will not provide baseline protections intended. Strengthen the rules by:

* clarifying chemical disclosure for first responders and medical emergencies. Medical professionals and first responders must be able to access chemical information on a 24-7 basis. [Subpart G, Section 245.730]

* eliminating potential abuse of emergency pits. First, require that drillers anticipate appropriate sized tanks for sufficient storage of flowback and produced water. Second, clarify that wastewater must be removed from the pit within 7 days of the event that triggered the use of the pit rather than 7 days after fracking operations are complete, in accordance with the law. [Subpart H, Sections 245.830 245.850]

* increasing administrative and operational penalties. Failure to

comply with the law should not be a cost of doing business, increase the fines to discourage non-compliance. [Subpart K, Section245.1120]

* protecting water resources. The presumption of water pollution should extend to the full range of chemicals used in the fracking process, and not be arbitrarily limited to select "indicator chemicals". [Subpart F, Section 245.620]

* defining threshold questions. Use of foams and gases in base fluids reduce the total gallons of fluid used in the fracking process, which will limit the number of fracking operations to which the law applies. Multipliers for foams and gases in base fluids must be identified so operators are not able to skirt the law by staying under minimum thresholds. [Subpart A, Section 245.110]

* requiring all high volume hydraulic fracturing operations to be subject to the law. We cannot allow operations that engage in HVHF to be exempt because they started prior to the adoption of the regulatory act. [Subpart A, Section 245.110]

* protecting public participation. Prevent companies from avoiding the public input process by amending their original applications; require significant permit modifications to be subject to the entire public process. [Subpart C, Section 245.330]

Laws and regulations are never going to make fracking safe. However, failure to adopt rules that reflect the baseline protections identified in the Hydraulic Fracturing Regulatory Act puts our drinking water and communities at greater risk.

I urge you to update the regulations to reflect the law.

Sincerely,

Kathy Young

I support clean, renewable energy and energy efficiency in IL. Mool,

I support fighting global climate change by advocating for laws and

policies that expand the use of homegrown renewable resources such as wind and solar.

I want my community to support renewable energy and expand local actions on sustainability.

I will support local businesses and political leaders who share the commitment to being sustainable and support my vision of protecting the environment.

Personally, I will attempt to be more energy efficient in my home, workplace, school, and transportation choices. I pledge to do my part to combat global climate change.

I Pledge,

Janet Ostrowski

Laws and regulations are never going to make fracking safe. However, failure to adopt rules that reflect the baseline protections identified in the Hydraulic Fracturing Regulatory Act puts our drinking water and communities at greater risk.

Strengthen the rules by:

* clarifying chemical disclosure for first responders and medical emergencies. Medical professionals and first responders must be able to access chemical information on a 24-7 basis. [Subpart G, Section 245.730]

* eliminating potential abuse of emergency pits. First, require that drillers anticipate appropriate sized tanks for sufficient storage of flowback and produced water. Second, clarify that wastewater must be removed from the pit within 7 days of the event that triggered the use of the pit rather than 7 days after fracking operations are complete, in accordance with the law. [Subpart H, Sections 245.830 245.850]

* increasing administrative and operational penalties. Failure to comply with the law should not be a cost of doing business, increase the fines to discourage non-compliance. [Subpart K, Section245.1120]

* protecting water resources. The presumption of water pollution should extend to the full range of chemicals used in the fracking process, and not be arbitrarily limited to select "indicator chemicals". [Subpart F, Section 245.620]

* defining threshold questions. Use of foams and gases in base fluids reduce the total gallons of fluid used in the fracking process, which will limit the number of fracking operations to which the law applies. Multipliers for foams and gases in base fluids must be identified so operators are not able to skirt the law by staying under minimum thresholds. [Subpart A, Section 245.110]

* requiring all high volume hydraulic fracturing operations to be

subject to the law. We cannot allow operations that engage in HVHF to be exempt because they started prior to the adoption of the regulatory act. [Subpart A, Section 245.110]

* protecting public participation. Prevent companies from avoiding the public input process by amending their original applications; require significant permit modifications to be subject to the entire public process. [Subpart C, Section 245.330]

The Hydraulic Fracturing Regulatory Act is a regulatory floor, and in no way makes high-volume hydraulic fracturing safe. The rules developed to better define the Act were to be the foundation to establish baseline minimum protections. Unfortunately the rules developed do not reflect the law that was passed.

I urge you to update the regulations to reflect the law.

Sincerely,

J Beverly

Dear Mool,

Laws and regulations are never going to make fracking safe. However, failure to adopt rules that reflect the baseline protections identified in the Hydraulic Fracturing Regulatory Act puts our drinking water and communities at greater risk.

Strengthen the rules by:

* clarifying chemical disclosure for first responders and medical emergencies. Medical professionals and first responders must be able to access chemical information on a 24-7 basis. [Subpart G, Section 245.730]

* eliminating potential abuse of emergency pits. First, require that drillers anticipate appropriate sized tanks for sufficient storage of flowback and produced water. Second, clarify that wastewater must be removed from the pit within 7 days of the event that triggered the use of the pit rather than 7 days after fracking operations are complete, in accordance with the law. [Subpart H, Sections 245.830 245.850]

* increasing administrative and operational penalties. Failure to comply with the law should not be a cost of doing business, increase the fines to discourage non-compliance. [Subpart K, Section245.1120]

* protecting water resources. The presumption of water pollution should extend to the full range of chemicals used in the fracking process, and not be arbitrarily limited to select "indicator chemicals". [Subpart F, Section 245.620]

* defining threshold questions. Use of foams and gases in base fluids reduce the total gallons of fluid used in the fracking process, which will limit the number of fracking operations to which the law applies. Multipliers for foams and gases in base fluids must be identified so operators are not able to skirt the law by staying under minimum thresholds. [Subpart A, Section 245.110]

* requiring all high volume hydraulic fracturing operations to be subject to the law. We cannot allow operations that engage in HVHF to be exempt because they started prior to the adoption of the regulatory act. [Subpart A, Section 245.110]

* protecting public participation. Prevent companies from avoiding the public input process by amending their original applications; require significant permit modifications to be subject to the entire public process. [Subpart C, Section 245.330]

Dear Mool,

Laws and regulations are never going to make fracking safe. However, failure to adopt rules that reflect the baseline protections identified in the Hydraulic Fracturing Regulatory Act puts our drinking water and communities at greater risk.

Strengthen the rules by:

* clarifying chemical disclosure for first responders and medical emergencies. Medical professionals and first responders must be able to access chemical information on a 24-7 basis. [Subpart G, Section 245.730]

* eliminating potential abuse of emergency pits. First, require that drillers anticipate appropriate sized tanks for sufficient storage of flowback and produced water. Second, clarify that wastewater must be removed from the pit within 7 days of the event that triggered the use

of the pit rather than 7 days after fracking operations are complete, in accordance with the law. [Subpart H, Sections 245.830 245.850]

* increasing administrative and operational penalties. Failure to comply with the law should not be a cost of doing business, increase the fines to discourage non-compliance. [Subpart K, Section245.1120]

* protecting water resources. The presumption of water pollution should extend to the full range of chemicals used in the fracking process, and not be arbitrarily limited to select "indicator chemicals". [Subpart F, Section 245.620]

* defining threshold questions. Use of foams and gases in base fluids reduce the total gallons of fluid used in the fracking process, which will limit the number of fracking operations to which the law applies. Multipliers for foams and gases in base fluids must be identified so operators are not able to skirt the law by staying under minimum thresholds. [Subpart A, Section 245.110]

* requiring all high volume hydraulic fracturing operations to be subject to the law. We cannot allow operations that engage in HVHF to be exempt because they started prior to the adoption of the regulatory act. [Subpart A, Section 245.110]

* protecting public participation. Prevent companies from avoiding the public input process by amending their original applications; require significant permit modifications to be subject to the entire public process. [Subpart C, Section 245.330]

The Hydraulic Fracturing Regulatory Act is a regulatory floor, and in no way makes high-volume hydraulic fracturing safe. The rules developed to better define the Act were to be the foundation to establish baseline minimum protections. Unfortunately the rules developed do not reflect the law that was passed.

I urge you to update the regulations to reflect the law.

Sincerely,

Christy Mazrimas-Ott

Use of foams and gases in base fluids reduce the total gallons of fluid used in the fracking process, which will limit the number of fracking operations to which the law applies. Multipliers for foams and gases in base fluids must be identified so operators are not able to skirt the law by staying under minimum thresholds. [Subpart A, Section 245.110]

* requiring all high volume hydraulic fracturing operations to be subject to the law. We cannot allow operations that engage in HVHF to be exempt because they started prior to the adoption of the regulatory act. [Subpart A, Section 245.110]

* protecting public participation. Prevent companies from avoiding the public input process by amending their original applications; require significant permit modifications to be subject to the entire public process. [Subpart C, Section 245.330]

The Hydraulic Fracturing Regulatory Act is a regulatory floor, and in no way makes high-volume hydraulic fracturing safe. The rules developed to better define the Act were to be the foundation to establish baseline minimum protections. Unfortunately the rules developed do not reflect the law that was passed.

I urge you to update the regulations to reflect the law.

Sincerely,

wookie h

Dear Mool,

Laws and regulations are never going to make fracking safe. However, failure to adopt rules that reflect the baseline protections identified in the Hydraulic Fracturing Regulatory Act puts our drinking water and communities at greater risk.

Strengthen the rules by:

* clarifying chemical disclosure for first responders and medical emergencies. Medical professionals and first responders must be able to access chemical information on a 24-7 basis. [Subpart G, Section 245.730]

* eliminating potential abuse of emergency pits. First, require that drillers anticipate appropriate sized tanks for sufficient storage of flowback and produced water. Second, clarify that wastewater must be removed from the pit within 7 days of the event that triggered the use of the pit rather than 7 days after fracking operations are complete, in accordance with the law. [Subpart H, Sections 245.830 245.850]

* increasing administrative and operational penalties. Failure to comply with the law should not be a cost of doing business, increase the fines to discourage non-compliance. [Subpart K, Section245.1120]

* protecting water resources. The presumption of water pollution should extend to the full range of chemicals used in the fracking process, and not be arbitrarily limited to select "indicator chemicals". [Subpart F, Section 245.620]

* defining threshold questions. Use of foams and gases in base fluids reduce the total gallons of fluid used in the fracking process, which will limit the number of fracking operations to which the law applies. Multipliers for foams and gases in base fluids must be identified so operators are not able to skirt the law by staying under minimum thresholds. [Subpart A, Section 245.110]

* requiring all high volume hydraulic fracturing operations to be subject to the law. We cannot allow operations that engage in HVHF to be exempt because they started prior to the adoption of the regulatory act. [Subpart A, Section 245.110]

Dear Mool,

Laws and regulations are never going to make fracking safe. However, failure to adopt rules that reflect the baseline protections identified in the Hydraulic Fracturing Regulatory Act puts our drinking water and communities at greater risk.

Strengthen the rules by:

* clarifying chemical disclosure for first responders and medical emergencies. Medical professionals and first responders must be able to access chemical information on a 24-7 basis. [Subpart G, Section 245.730]

* eliminating potential abuse of emergency pits. First, require that drillers anticipate appropriate sized tanks for sufficient storage of flowback and produced water. Second, clarify that wastewater must be removed from the pit within 7 days of the event that triggered the use of the pit rather than 7 days after fracking operations are complete, in accordance with the law. [Subpart H, Sections 245.830 245.850]

* increasing administrative and operational penalties. Failure to comply with the law should not be a cost of doing business, increase the fines to discourage non-compliance. [Subpart K, Section245.1120]

* protecting water resources. The presumption of water pollution should extend to the full range of chemicals used in the fracking process, and not be arbitrarily limited to select "indicator chemicals". [Subpart F, Section 245.620]

* defining threshold questions. Use of foams and gases in base fluids reduce the total gallons of fluid used in the fracking process, which will limit the number of fracking operations to which the law applies. Multipliers for foams and gases in base fluids must be identified so operators are not able to skirt the law by staying under minimum thresholds. [Subpart A, Section 245.110]

* requiring all high volume hydraulic fracturing operations to be subject to the law. We cannot allow operations that engage in HVHF to be exempt because they started prior to the adoption of the regulatory act. [Subpart A, Section 245.110]

* protecting public participation. Prevent companies from avoiding the public input process by amending their original applications; require significant permit modifications to be subject to the entire public process. [Subpart C, Section 245.330]

The Hydraulic Fracturing Regulatory Act is a regulatory floor, and in no way makes high-volume hydraulic fracturing safe. The rules developed to better define the Act were to be the foundation to establish baseline minimum protections. Unfortunately the rules developed do not reflect the law that was passed.

I urge you to update the regulations to reflect the law.

Sincerely,

Susan Barrons

IL

I support clean, renewable energy and energy efficiency in IL. Mool,

I support fighting global climate change by advocating for laws and policies that expand the use of homegrown renewable resources such as wind and solar.

I want my community to support renewable energy and expand local actions on sustainability.

I will support local businesses and political leaders who share the commitment to being sustainable and support my vision of protecting the environment.

Personally, I will attempt to be more energy efficient in my home, workplace, school, and transportation choices. I pledge to do my part to combat global climate change.

I Pledge,

Harrison Bertram

The rules developed to better define the Act were to be the foundation to establish baseline minimum protections. Unfortunately the rules developed do not reflect the law that was passed, and until strengthened will not provide baseline protections intended. Strengthen the rules by:

* clarifying chemical disclosure for first responders and medical emergencies. Medical professionals and first responders must be able to access chemical information on a 24-7 basis. [Subpart G, Section 245.730]

* eliminating potential abuse of emergency pits. First, require that drillers anticipate appropriate sized tanks for sufficient storage of flowback and produced water. Second, clarify that wastewater must be removed from the pit within 7 days of the event that triggered the use

of the pit rather than 7 days after fracking operations are complete, in accordance with the law. [Subpart H, Sections 245.830 245.850]

* increasing administrative and operational penalties. Failure to comply with the law should not be a cost of doing business, increase the fines to discourage non-compliance. [Subpart K, Section245.1120]

* protecting water resources. The presumption of water pollution should extend to the full range of chemicals used in the fracking process, and not be arbitrarily limited to select "indicator chemicals". [Subpart F, Section 245.620]

* defining threshold questions. Use of foams and gases in base fluids reduce the total gallons of fluid used in the fracking process, which will limit the number of fracking operations to which the law applies. Multipliers for foams and gases in base fluids must be identified so operators are not able to skirt the law by staying under minimum thresholds. [Subpart A, Section 245.110]

* requiring all high volume hydraulic fracturing operations to be subject to the law. We cannot allow operations that engage in HVHF to be exempt because they started prior to the adoption of the regulatory act. [Subpart A, Section 245.110]

* protecting public participation. Prevent companies from avoiding the public input process by amending their original applications; require significant permit modifications to be subject to the entire public process. [Subpart C, Section 245.330]

Laws and regulations are never going to make fracking safe. However, failure to adopt rules that reflect the baseline protections identified in the Hydraulic Fracturing Regulatory Act puts our drinking water and communities at greater risk.

I urge you to update the regulations to reflect the law.

Sincerely,

Janis Sawyer

Use of foams and gases in base fluids reduce the total gallons of fluid used in the fracking process, which will limit the number of fracking operations to which the law applies. Multipliers for foams and gases in base fluids must be identified so operators are not able to skirt the law by staying under minimum thresholds. [Subpart A, Section 245.110]

* requiring all high volume hydraulic fracturing operations to be

subject to the law. We cannot allow operations that engage in HVHF to be exempt because they started prior to the adoption of the regulatory act. [Subpart A, Section 245.110]

* protecting public participation. Prevent companies from avoiding the public input process by amending their original applications; require significant permit modifications to be subject to the entire public process. [Subpart C, Section 245.330]

Laws and regulations are never going to make fracking safe. However, failure to adopt rules that reflect the baseline protections identified in the Hydraulic Fracturing Regulatory Act puts our drinking water and communities at greater risk.

I urge you to update the regulations to reflect the law.

Sincerely,

Mytzi Rudolph

Dear Mool,

The Hydraulic Fracturing Regulatory Act is a regulatory floor, and in no way makes high-volume hydraulic fracturing safe. The rules developed to better define the Act were to be the foundation to establish baseline minimum protections. Unfortunately the rules developed do not reflect the law that was passed, and until strengthened will not provide baseline protections intended. Strengthen the rules by:

* clarifying chemical disclosure for first responders and medical emergencies. Medical professionals and first responders must be able to access chemical information on a 24-7 basis. [Subpart G, Section 245.730]

* eliminating potential abuse of emergency pits. First, require that

drillers anticipate appropriate sized tanks for sufficient storage of flowback and produced water. Second, clarify that wastewater must be removed from the pit within 7 days of the event that triggered the use of the pit rather than 7 days after fracking operations are complete, in accordance with the law. [Subpart H, Sections 245.830  245.850]

* increasing administrative and operational penalties. Failure to comply with the law should not be a cost of doing business, increase the fines to discourage non-compliance. [Subpart K, Section245.1120]

* protecting water resources. The presumption of water pollution should extend to the full range of chemicals used in the fracking process, and not be arbitrarily limited to select "indicator chemicals". [Subpart F, Section 245.620]

* defining threshold questions. Use of foams and gases in base fluids reduce the total gallons of fluid used in the fracking process, which will limit the number of fracking operations to which the law applies. Multipliers for foams and gases in base fluids must be identified so operators are not able to skirt the law by staying under minimum thresholds. [Subpart A, Section 245.110]

* requiring all high volume hydraulic fracturing operations to be subject to the law. We cannot allow operations that engage in HVHF to be exempt because they started prior to the adoption of the regulatory act. [Subpart A, Section 245.110]

*  protecting public participation. Prevent companies from avoiding the public input process by amending their original applications; require significant permit modifications to be subject to the entire public process. [Subpart C, Section 245.330]

Dear Mool,

The Hydraulic Fracturing Regulatory Act is a regulatory floor, and in no way makes high-volume hydraulic fracturing safe. The rules developed to better define the Act were to be the foundation to establish baseline minimum protections. Unfortunately the rules developed do not reflect the law that was passed, and until strengthened will not provide baseline protections intended. Strengthen the rules by:

* clarifying chemical disclosure for first responders and medical emergencies. Medical professionals and first responders must be able to access chemical information on a 24-7 basis. [Subpart G, Section 245.730]

* eliminating potential abuse of emergency pits. First, require that drillers anticipate appropriate sized tanks for sufficient storage of flowback and produced water. Second, clarify that wastewater must be removed from the pit within 7 days of the event that triggered the use of the pit rather than 7 days after fracking operations are complete, in accordance with the law. [Subpart H, Sections 245.830 245.850]

* increasing administrative and operational penalties. Failure to comply with the law should not be a cost of doing business, increase the fines to discourage non-compliance. [Subpart K, Section245.1120]

* protecting water resources. The presumption of water pollution should extend to the full range of chemicals used in the fracking process, and not be arbitrarily limited to select "indicator chemicals". [Subpart F, Section 245.620]

* defining threshold questions. Use of foams and gases in base fluids reduce the total gallons of fluid used in the fracking process, which will limit the number of fracking operations to which the law applies. Multipliers for foams and gases in base fluids must be identified so operators are not able to skirt the law by staying under minimum thresholds. [Subpart A, Section 245.110]

* requiring all high volume hydraulic fracturing operations to be subject to the law. We cannot allow operations that engage in HVHF to be exempt because they started prior to the adoption of the regulatory act. [Subpart A, Section 245.110]

* protecting public participation. Prevent companies from avoiding the public input process by amending their original applications; require significant permit modifications to be subject to the entire public process. [Subpart C, Section 245.330]

Laws and regulations are never going to make fracking safe. However, failure to adopt rules that reflect the baseline protections identified in the Hydraulic Fracturing Regulatory Act puts our drinking water and communities at greater risk.

I urge you to update the regulations to reflect the law.

Sincerely,

Diana Alexander

* defining threshold questions. Use of foams and gases in base fluids reduce the total gallons of fluid used in the fracking process, which will limit the number of fracking operations to which the law applies. Multipliers for foams and gases in base fluids must be identified so operators are not able to skirt the law by staying under minimum thresholds. [Subpart A, Section 245.110]

* requiring all high volume hydraulic fracturing operations to be subject to the law. We cannot allow operations that engage in HVHF to be exempt because they started prior to the adoption of the regulatory act. [Subpart A, Section 245.110]

* protecting public participation. Prevent companies from avoiding the public input process by amending their original applications; require significant permit modifications to be subject to the entire public process. [Subpart C, Section 245.330]

The Hydraulic Fracturing Regulatory Act is a regulatory floor, and in no way makes high-volume hydraulic fracturing safe. The rules developed to better define the Act were to be the foundation to establish baseline minimum protections. Unfortunately the rules developed do not reflect the law that was passed.

I urge you to update the regulations to reflect the law.

Sincerely,

Carolynne Cullerton

Dear Mool,

The Hydraulic Fracturing Regulatory Act is a regulatory floor, and in no way makes high-volume hydraulic fracturing safe. The rules developed to better define the Act were to be the foundation to establish baseline minimum protections. Unfortunately the rules developed do not reflect the law that was passed, and until strengthened will not provide baseline protections intended. Strengthen the rules by:

* clarifying chemical disclosure for first responders and medical emergencies. Medical professionals and first responders must be able to access chemical information on a 24-7 basis. [Subpart G, Section 245.730]

* eliminating potential abuse of emergency pits. First, require that drillers anticipate appropriate sized tanks for sufficient storage of flowback and produced water. Second, clarify that wastewater must be removed from the pit within 7 days of the event that triggered the use of the pit rather than 7 days after fracking operations are complete, in accordance with the law. [Subpart H, Sections 245.830 245.850]

* increasing administrative and operational penalties. Failure to

comply with the law should not be a cost of doing business, increase the fines to discourage non-compliance. [Subpart K, Section245.1120]

* protecting water resources. The presumption of water pollution should extend to the full range of chemicals used in the fracking process, and not be arbitrarily limited to select "indicator chemicals". [Subpart F, Section 245.620]

* defining threshold questions. Use of foams and gases in base fluids reduce the total gallons of fluid used in the fracking process, which will limit the number of fracking operations to which the law applies. Multipliers for foams and gases in base fluids must be identified so operators are not able to skirt the law by staying under minimum thresholds. [Subpart A, Section 245.110]

* requiring all high volume hydraulic fracturing operations to be subject to the law. We cannot allow operations that engage in HVHF to be exempt because they started prior to the adoption of the regulatory act. [Subpart A, Section 245.110]

* protecting public participation. Prevent companies from avoiding the public input process by amending their original applications; require significant permit modifications to be subject to the entire public process. [Subpart C, Section 245.330]

Laws and regulations are never going to make fracking safe. However, failure to adopt rules that reflect the baseline protections identified in the Hydraulic Fracturing Regulatory Act puts our drinking water and communities at greater risk.

I urge you to update the regulations to reflect the law.

Dear Mool,

The Hydraulic Fracturing Regulatory Act is a regulatory floor, and in no way makes high-volume hydraulic fracturing safe. The rules developed to better define the Act were to be the foundation to establish baseline minimum protections. Unfortunately the rules developed do not reflect the law that was passed, and until strengthened will not provide baseline protections intended. Strengthen the rules by:

* clarifying chemical disclosure for first responders and medical emergencies. Medical professionals and first responders must be able to access chemical information on a 24-7 basis. [Subpart G, Section 245.730]

* eliminating potential abuse of emergency pits. First, require that drillers anticipate appropriate sized tanks for sufficient storage of flowback and produced water. Second, clarify that wastewater must be removed from the pit within 7 days of the event that triggered the use of the pit rather than 7 days after fracking operations are complete, in accordance with the law. [Subpart H, Sections 245.830 245.850]

* increasing administrative and operational penalties. Failure to comply with the law should not be a cost of doing business, increase the fines to discourage non-compliance. [Subpart K, Section245.1120]

* protecting water resources. The presumption of water pollution should extend to the full range of chemicals used in the fracking process, and not be arbitrarily limited to select "indicator chemicals". [Subpart F, Section 245.620]

* defining threshold questions. Use of foams and gases in base fluids reduce the total gallons of fluid used in the fracking process, which will limit the number of fracking operations to which the law applies. Multipliers for foams and gases in base fluids must be identified so operators are not able to skirt the law by staying under minimum thresholds. [Subpart A, Section 245.110]

* requiring all high volume hydraulic fracturing operations to be subject to the law. We cannot allow operations that engage in HVHF to

be exempt because they started prior to the adoption of the regulatory act. [Subpart A, Section 245.110]

* protecting public participation. Prevent companies from avoiding the public input process by amending their original applications; require significant permit modifications to be subject to the entire public process. [Subpart C, Section 245.330]

Laws and regulations are never going to make fracking safe. However, failure to adopt rules that reflect the baseline protections identified in the Hydraulic Fracturing Regulatory Act puts our drinking water and communities at greater risk.

I urge you to update the regulations to reflect the law.

Sincerely,

Susan Clancy

Use of foams and gases in base fluids reduce the total gallons of fluid used in the fracking process, which will limit the number of fracking operations to which the law applies. Multipliers for foams and gases in base fluids must be identified so operators are not able to skirt the law by staying under minimum thresholds. [Subpart A, Section 245.110]

* requiring all high volume hydraulic fracturing operations to be subject to the law. We cannot allow operations that engage in HVHF to be exempt because they started prior to the adoption of the regulatory act. [Subpart A, Section 245.110]

* protecting public participation. Prevent companies from avoiding the public input process by amending their original applications; require significant permit modifications to be subject to the entire public process. [Subpart C, Section 245.330]

Laws and regulations are never going to make fracking safe. However, failure to adopt rules that reflect the baseline protections identified in the Hydraulic Fracturing Regulatory Act puts our drinking water and communities at greater risk.

I urge you to update the regulations to reflect the law.

Sincerely,

Michael Arveson

Dear Mool,

Laws and regulations are never going to make fracking safe. However, failure to adopt rules that reflect the baseline protections identified in the Hydraulic Fracturing Regulatory Act puts our drinking water and communities at greater risk.

Strengthen the rules by:

* clarifying chemical disclosure for first responders and medical emergencies. Medical professionals and first responders must be able to access chemical information on a 24-7 basis. [Subpart G, Section 245.730]

* eliminating potential abuse of emergency pits. First, require that drillers anticipate appropriate sized tanks for sufficient storage of flowback and produced water. Second, clarify that wastewater must be removed from the pit within 7 days of the event that triggered the use of the pit rather than 7 days after fracking operations are complete, in accordance with the law. [Subpart H, Sections 245.830 245.850]

* increasing administrative and operational penalties. Failure to comply with the law should not be a cost of doing business, increase the fines to discourage non-compliance. [Subpart K, Section245.1120]

* protecting water resources. The presumption of water pollution should extend to the full range of chemicals used in the fracking process, and not be arbitrarily limited to select "indicator chemicals". [Subpart F, Section 245.620]

* defining threshold questions. Use of foams and gases in base fluids reduce the total gallons of fluid used in the fracking process, which will limit the number of fracking operations to which the law applies. Multipliers for foams and gases in base fluids must be identified so operators are not able to skirt the law by staying under minimum

thresholds. [Subpart A, Section 245.110]

* requiring all high volume hydraulic fracturing operations to be subject to the law. We cannot allow operations that engage in HVHF to be exempt because they started prior to the adoption of the regulatory act. [Subpart A, Section 245.110]

* protecting public participation. Prevent companies from avoiding the public input process by amending their original applications; require significant permit modifications to be subject to the entire public process. [Subpart C, Section 245.330]

The Hydraulic Fracturing Regulatory Act is a regulatory floor, and in no way makes high-volume hydraulic fracturing safe. The rules developed to better define the Act were to be the foundation to establish baseline minimum protections. Unfortunately the rules developed do not reflect the law that was passed.

I urge you to update the regulations to reflect the law.

Dear Mool,

The Hydraulic Fracturing Regulatory Act is a regulatory floor, and in no way makes high-volume hydraulic fracturing safe. The rules developed to better define the Act were to be the foundation to establish baseline minimum protections. Unfortunately the rules developed do not reflect the law that was passed, and until strengthened will not provide baseline protections intended. Strengthen the rules by:

* clarifying chemical disclosure for first responders and medical emergencies. Medical professionals and first responders must be able to access chemical information on a 24-7 basis. [Subpart G, Section 245.730]

* eliminating potential abuse of emergency pits. First, require that drillers anticipate appropriate sized tanks for sufficient storage of flowback and produced water. Second, clarify that wastewater must be removed from the pit within 7 days of the event that triggered the use of the pit rather than 7 days after fracking operations are complete, in accordance with the law. [Subpart H, Sections 245.830 245.850]

* increasing administrative and operational penalties. Failure to comply with the law should not be a cost of doing business, increase the fines to discourage non-compliance. [Subpart K, Section245.1120]

* protecting water resources. The presumption of water pollution should extend to the full range of chemicals used in the fracking process, and not be arbitrarily limited to select "indicator chemicals". [Subpart F, Section 245.620]

* defining threshold questions. Use of foams and gases in base fluids reduce the total gallons of fluid used in the fracking process, which will limit the number of fracking operations to which the law applies. Multipliers for foams and gases in base fluids must be identified so operators are not able to skirt the law by staying under minimum thresholds. [Subpart A, Section 245.110]

* requiring all high volume hydraulic fracturing operations to be subject to the law. We cannot allow operations that engage in HVHF to be exempt because they started prior to the adoption of the regulatory act. [Subpart A, Section 245.110]

* protecting public participation. Prevent companies from avoiding the public input process by amending their original applications; require significant permit modifications to be subject to the entire public process. [Subpart C, Section 245.330]

Laws and regulations are never going to make fracking safe. However,

failure to adopt rules that reflect the baseline protections identified in the Hydraulic Fracturing Regulatory Act puts our drinking water and communities at greater risk.

I urge you to update the regulations to reflect the law.

Sincerely,

Jake Turner

Use of foams and gases in base fluids reduce the total gallons of fluid used in the fracking process, which will limit the number of fracking operations to which the law applies. Multipliers for foams and gases in base fluids must be identified so operators are not able to skirt the law by staying under minimum thresholds. [Subpart A, Section 245.110]

* requiring all high volume hydraulic fracturing operations to be subject to the law. We cannot allow operations that engage in HVHF to be exempt because they started prior to the adoption of the regulatory act. [Subpart A, Section 245.110]

* protecting public participation. Prevent companies from avoiding the public input process by amending their original applications; require significant permit modifications to be subject to the entire public process. [Subpart C, Section 245.330]

The Hydraulic Fracturing Regulatory Act is a regulatory floor, and in no way makes high-volume hydraulic fracturing safe. The rules developed to better define the Act were to be the foundation to establish baseline minimum protections. Unfortunately the rules developed do not reflect the law that was passed.

I urge you to update the regulations to reflect the law.

Sincerely,

Miro Gal

Dear Mool,

Laws and regulations are never going to make fracking safe. However, failure to adopt rules that reflect the baseline protections identified in the Hydraulic Fracturing Regulatory Act puts our drinking water and communities at greater risk.

Strengthen the rules by:

* clarifying chemical disclosure for first responders and medical emergencies. Medical professionals and first responders must be able to access chemical information on a 24-7 basis. [Subpart G, Section 245.730]

* eliminating potential abuse of emergency pits. First, require that drillers anticipate appropriate sized tanks for sufficient storage of flowback and produced water. Second, clarify that wastewater must be removed from the pit within 7 days of the event that triggered the use of the pit rather than 7 days after fracking operations are complete, in accordance with the law. [Subpart H, Sections 245.830 245.850]

* increasing administrative and operational penalties. Failure to comply with the law should not be a cost of doing business, increase the fines to discourage non-compliance. [Subpart K, Section245.1120]

* protecting water resources. The presumption of water pollution should extend to the full range of chemicals used in the fracking process, and not be arbitrarily limited to select "indicator chemicals". [Subpart F, Section 245.620]

* defining threshold questions. Use of foams and gases in base fluids reduce the total gallons of fluid used in the fracking process, which will limit the number of fracking operations to which the law applies. Multipliers for foams and gases in base fluids must be identified so

operators are not able to skirt the law by staying under minimum thresholds. [Subpart A, Section 245.110]

* requiring all high volume hydraulic fracturing operations to be subject to the law. We cannot allow operations that engage in HVHF to be exempt because they started prior to the adoption of the regulatory act. [Subpart A, Section 245.110]

* protecting public participation. Prevent companies from avoiding the public input process by amending their original applications; require significant permit modifications to be subject to the entire public process. [Subpart C, Section 245.330]

IL

Dear Mool,

Laws and regulations are never going to make fracking safe. However, failure to adopt rules that reflect the baseline protections identified in the Hydraulic Fracturing Regulatory Act puts our drinking water and communities at greater risk.

Strengthen the rules by:

* clarifying chemical disclosure for first responders and medical emergencies. Medical professionals and first responders must be able to access chemical information on a 24-7 basis. [Subpart G, Section 245.730]

* eliminating potential abuse of emergency pits. First, require that drillers anticipate appropriate sized tanks for sufficient storage of flowback and produced water. Second, clarify that wastewater must be removed from the pit within 7 days of the event that triggered the use of the pit rather than 7 days after fracking operations are complete, in accordance with the law. [Subpart H, Sections 245.830 245.850]

* increasing administrative and operational penalties. Failure to comply with the law should not be a cost of doing business, increase the fines to discourage non-compliance. [Subpart K, Section245.1120]

* protecting water resources. The presumption of water pollution should extend to the full range of chemicals used in the fracking process, and not be arbitrarily limited to select "indicator chemicals". [Subpart F, Section 245.620]

* defining threshold questions. Use of foams and gases in base fluids reduce the total gallons of fluid used in the fracking process, which will limit the number of fracking operations to which the law applies. Multipliers for foams and gases in base fluids must be identified so operators are not able to skirt the law by staying under minimum thresholds. [Subpart A, Section 245.110]

* requiring all high volume hydraulic fracturing operations to be subject to the law. We cannot allow operations that engage in HVHF to

be exempt because they started prior to the adoption of the regulatory act. [Subpart A, Section 245.110]

* protecting public participation. Prevent companies from avoiding the public input process by amending their original applications; require significant permit modifications to be subject to the entire public process. [Subpart C, Section 245.330]

The Hydraulic Fracturing Regulatory Act is a regulatory floor, and in no way makes high-volume hydraulic fracturing safe. The rules developed to better define the Act were to be the foundation to establish baseline minimum protections. Unfortunately the rules developed do not reflect the law that was passed.

I urge you to update the regulations to reflect the law.

Sincerely,

John Stanfa

* protecting public participation. Prevent companies from avoiding the public input process by amending their original applications; require significant permit modifications to be subject to the entire public process. [Subpart C, Section 245.330]

The Hydraulic Fracturing Regulatory Act is a regulatory floor, and in no way makes high-volume hydraulic fracturing safe. The rules developed to better define the Act were to be the foundation to establish baseline minimum protections. Unfortunately the rules developed do not reflect the law that was passed.

I urge you to update the regulations to reflect the law.

Sincerely,

Cuck Witt

Dear Mool,

Laws and regulations are never going to make fracking safe. However, failure to adopt rules that reflect the baseline protections identified in the Hydraulic Fracturing Regulatory Act puts our drinking water and communities at greater risk.

Strengthen the rules by:

* clarifying chemical disclosure for first responders and medical emergencies. Medical professionals and first responders must be able to access chemical information on a 24-7 basis. [Subpart G, Section 245.730]

* eliminating potential abuse of emergency pits. First, require that drillers anticipate appropriate sized tanks for sufficient storage of flowback and produced water. Second, clarify that wastewater must be removed from the pit within 7 days of the event that triggered the use of the pit rather than 7 days after fracking operations are complete, in accordance with the law. [Subpart H, Sections 245.830 245.850]

* increasing administrative and operational penalties. Failure to comply with the law should not be a cost of doing business, increase the fines to discourage non-compliance. [Subpart K, Section245.1120]

* protecting water resources. The presumption of water pollution should extend to the full range of chemicals used in the fracking process, and not be arbitrarily limited to select "indicator chemicals". [Subpart F, Section 245.620]

* defining threshold questions. Use of foams and gases in base fluids reduce the total gallons of fluid used in the fracking process, which will limit the number of fracking operations to which the law applies. Multipliers for foams and gases in base fluids must be identified so operators are not able to skirt the law by staying under minimum thresholds. [Subpart A, Section 245.110]

* requiring all high volume hydraulic fracturing operations to be subject to the law. We cannot allow operations that engage in HVHF to be exempt because they started prior to the adoption of the regulatory act. [Subpart A, Section 245.110]

* protecting public participation. Prevent companies from avoiding the public input process by amending their original applications; require significant permit modifications to be subject to the entire public process. [Subpart C, Section 245.330]

The Hydraulic Fracturing Regulatory Act is a regulatory floor, and in no way makes high-volume hydraulic fracturing safe. The rules developed to better define the Act were to be the foundation to establish baseline minimum protections. Unfortunately the rules developed do not reflect the law that was passed.
