ABSTRACT

An Illinois Mud Turtle (Kinosternon flavescens spooneri) Survey was conducted by the Lee County Natural Area Guardians, June 2 - 6 and June 9 - 13, 1986. The survey was funded by the Illinois Nongame Wildlife Conservation Checkoff Program. Sites were selected in the Green River Low Lands in the southwestern part of Lee County, Illinois. A total of eighty-eight turtles were surveyed. One Illinios Mud Turtle (Kinosternon flavescens spooneri) was found along with thirteen Blanding's Turtles (Emydoidea blandingi). Twenty-three sites were trapped.

INTRODUCTION

Presettlement Lee County was the site of two large swamps, totaling 50,000 acres. Much of the wetland wildlife habitat in the County was destroyed between 1887 and 1901. True wetlands or marsh areas are very limited in Lee County today. The last inventory in 1927 listed only 47 square miles as late swamp or bottomland soils. The Green River Low Lands, site of the survey, consists of water filled depressions in poorly drained soils.

The Illinois Mud Turtle is listed as endangered in Illinois. The species has a limited range. Small known populations are found at scattered sites in Illinois.

The first known finding of an Illinois Mud Turtle in Lee County was in 1970 in the Green River Conservation Area. During the extensive search conducted for Monsanto in 1979 no Illinois Mud Turtles were found in Lee County. In the spring of 1985 a large adult male was found on the County's west border.

METHODOLOGY

In October, 1985 the Lee County Natural Area Guardians applied for funds from the Illinois Nongame Wildlife Conservation Checkoff Program to conduct an Illinois Mud Turtle Survey. A contract with the Illinois Department of Conservation was signed April 15, 1986.

In preparation for the anticipated funding the Natural Area Guardians held a February training session. Instructed by Randy Nyboer, Natural Heritage Biologist, Illinois Department of Conservation, the trappers became

familiar with the turtles habitat requirements. Natural Area Guardian members learned how to identify characteristics unique to the Illinois Mud Turtle. Actual traps were assembled at the training session. Humane marking of specimens was demonstrated and members were given the opportunity to practice the techniques.

Following notification of funding an informational sheet was prepared and printed. The sheet, in a WANTED poster form, was mailed to all owner/operators in southwestern Lee County. The area included Harmon, Hamilton, Marion, East Grove, Amboy, May, Lee Center, and Sublette townships. It was also distributed to Amboy School students.

The poster (exhibit I) showed characteristics of the Illinois Mud Turtle for identification, habitat needs and procedure to follow if a turtle was sighted or captured. Several news releases were issued to local media as well as articles in the Lee County Soil and Water Conservation District newsletter. (exhibit II & III)

Trapping site selection was made from the Natural Area Guardian ongoing, locally significant, natural area inventory. Once sites were chosen the landowner/operators were contacted by letter. (exhibit IV & V) The letter briefly explained the project and requested permission to survey their property. A stamped and addressed card was enclosed for the owners reply. Landowners were given the opportunity to participate in the trapping.

Files for each area were prepared. Included in the file was owners permission card, aerial (secured from ASCS), topographic map and any specific instructions needed. A County road map was also provided the trappers.

Trapping headquarters were set-up in a rented small shed in the rear of the USDA Service Center, Amboy, Illinois. The headquarters housed the scales, measuring tools, and recording equipment in addition to holding tubs for turtles awaiting data collection. The nearby Fredenhagen, Spears, Kessell, and Kellen sites were trapped the first week, June 2 - 6, 1986.

Hoop net traps were used in the trapping operation. Fresh chicken livers, secured in common screen wire, lured the turtles into the traps. After baiting the

traps they were placed in shallow water making sure there was opportunity for trapped turtles to surface for air. Traps were emptied and rebaited daily and water temperatures recorded. Precaution was taken to insure that captured turtles were grouped in mesh bags from individual sites, both for data records, marking and release. Turtles were held overnight in tubs with an inch or two of water.

Headquarters were moved the second week to the Carey farm located nearer the trapping sites. Trapped June 9 - 13, 1986 were Carey, Hinton, Zbinden, Spears, Broderick, Kant and Zimmerly sites.

Photographs were taken at numerous sites to document the project. Each species of turtle was photographed. Numerous pictures of the one Illinois Mud Turtle were shot. Enlargements depicting the turtle's identifying characteristics will be used in displays and in conjunction with the slide presentation.

A slide/tape show "Turtle Talk" was prepared for showing to interested persons, civic groups and schools. A brochure was printed as a hand-out at the slide show presentations. The slide show depicts the entire project from funding through training, trapping and data collection. The release of specimens to their original capture site is shown also. The presentation concludes with a request for viewers to aid in habitat preservation for the endangered Illinois Mud Turtle. (exhibit VI)

Letters were again sent to cooperating landowner/operators to express the Natural Area Guardians gratitude for their vital assistance in the project. Enclosed with the letter was a copy of the brochure "Turtle Talk". (exhibit VII)

RESULTS

One of the primary results of the survey was the data collected on the eighty-eight turtles captured in Lee County. Among those eighty-eight were: 39* Intermediate Painted Turtles, 25 Western Painted Turtles, 10 Midland Painted Turtles, 13** Blanding's Turtles (Emydoidea blandingi), and 1 Illinois Mud Turtle (Kinosternon flavescens spooneri).

* One Painted turtle was found crossing the road near the Spears site.

** One Blanding's was picked up by an area landowner and brought to trapping headquarters. (Referred to as Mazy Road Blanding's.)

(See detailed data sheets)

Secondary results of great importance to our County is the opportunity the survey presented to educate our citizens about the turtles in our locale. The survey with it's publicity and contacts with landowner/operators gave numerous opportunities for dispensing information concerning identification, habitat requirements, and means to aid these reptiles of our County. The project was very well received in our area.

The slide/tape show will add another tool for public education. Both young and old can see first hand the vital role they play in the animals survival. Requests for veiwing have all ready been received. The brochure "Turtle Talk" will be a reminder in the home and will encourage interest in these rare creatures.

Our group of trappers had a once-in-a-lifetime opportunity to learn from the Department of Conservation staff who assisted in the project. Each member learned volumes in addition to the fascinating experience of trapping turtles. Many interesting areas were visited and new nature enthusiasts sympathetic to our cause were contacted.

The survey allowed Lee County tax payers to see the results of their checkoff money in action in their own County.

CONCLUSION

The Natural Area Guardians will contact the landowner of the Illinois Mud Turtle site and discuss preservation of this site. There are some indications that the landowner may be planning some changes in land use on his property. Some of the sand ridge was cleared the fall of 1985. Attempts will be made to educate the site owner about this unique animal, an endangered Illinois species.

If conclusions can be made from such a limited study, it would appear that neither the Blanding's (Emydoidea blandingi) nor the Illinois Mud Turtle (Kinosternon flavescens spooneri) tolerate disturbance. The soil 4200 Orio mucky sandy loam, ponded, appeared in all areas where Blanding's were found, which also included the Illinois Mud Turtle site.

It is interesting too, that the 741D3 Oakville fine sand, 7 to 20% slope on the south edge of the

Illinois Mud Turtle site is found in conjunction with 200 Orio sandy loam at the site of the Illinois Mud Turtle found in the spring of 1985 at the County's west border. It would seem worthwhile to seek out more of this soil combination for trapping next year.

With the finding of thirteen Blanding's an interesting study of that species could be conducted in Lee County. The Spears pond #8 that yeilded five of the species would be the ideal site.

ACKNOWLEDGEMENTS

Sincere gratitude is extended to the Department of Conservation for their excellent guidance and assistance in this checkoff project. The project could not have been successfully completed without the assistance of Randy Nyboer, Dennis Jarrard, Mary Grapperhaus, Karen Townsend, Bill Glass, and Fran Harty. Equipment was also furnished by the Department of Conservation, such as traps, scales, calipers, thermometers, etc. Landowner cooperation proved to be of invaluable aid. Finally thank you to tax payers who realize the value of our nongame wildlife resources in Illinois and accept their responsibility to better understand the animals situation and aid in their preservation.

LEE CO. HYDROLOGIC UNITS

FIVE MAJOR RIVER SYSTEMS TAKE/RECEIVE SURFACE WATER FROM LEE COUNTY. CAN YOU NAME THEM?

Tributaries/creeks flow into the rivers - - completing the hydrologic pattern for delivery of excess rainfall.

The heavy rains came the third week of May, 1986, cutting a deep slice (sheet) of topsoil from the cropland and gouging gullies into the water courses. Sediment covers the bottomland!

Lct[illegible]e rainfall is uncontrolable; the runoff, erosion and sedimentation is controlable. Like the old story - - "the impossible takes a bit longer time."

Organize to benefit from soil and water resource opportunities. Lee County has 35 hydrologic units (see map on page 2 - circled numbers) to enable both the landowners and the District to concentrate resources to make an impact on the watersheds.

The "Four Mile Grove Creek" Watershed (#18 on Map) received $22,500 of "Build Illinois" money this year to help solve their erosion problems.

Benefits include increased net income farmers, lower production costs, increased crop yields, improved water quali lower ditch and road maintenance, etc

Discuss these things with your neighb and bring your ideas to the Soil Co vation Service Field Office in Amb the USDA Service Center.

NONGAME WILDLIFE CHECK-OFF FUNDS TO BE USED IN LEE COUNTY

The Lee County Natural Area Guardians (NAG) have been notified that a request for funding has received approval. The monies from the non-game wildlife check-off will be used for a Illinois Mud Turtle Survey in Lee County. These funds come from donations by concerned Illinois citizens who place a check-mark in the appropriate box on the Illinois Income Tax Form. If you are entitled to a State tax refund you may donate $10.00 to this fund. The checkoff money must be used for nongame wildlife which are not hunted or trapped. They constitute about 500 species and nearly 90% of all wildlife in Illinois. The tax deductible donation is used to preserve and protect wild populations of birds, mammals, and other wildlife seriously affected by modern civilization.

The NAG will be funded to survey the endangered Illinois Mud Turtle. This rare animal hibernates throughout the winter and becomes active in the Spring in sandy regions of central and northwestern Illinois. All the known Illinois Mud Turtles in the world live in Iowa, Illinois, and Missouri. As recent as last year, during a trapping project, 17 were found in Henry County. Their habitat requirements are sandy areas with shallow undisturbed ponds. Lee County has habitat to support this unique creature. A large adult male of this species was found on the County's west border in the Spring of 1985.

The Lee County project will be of a 4 or 5 day duration in late May or early June. Turtles will be trapped in baited traps placed in shallow water. Traps will be checked twice daily. Turtles found will be measured, sexed, aged and marked, then released. NAG members will document all of the activities on film enabling others to share in this exciting project. A brochure will be published containing detailed information learned through the inventory.

M.S.C. 1/1/86

The Dixon Telegraph contacted the Soil & Water Conservation District office and rewrote the article with a by-line by reporter John Kanthak.

Lee group to study mysterious mud turtle

By John Kanthak
Telegraph staff writer

AMBOY — The Lee County Natural Area Guardians will this spring will use Illinois tax dollars to study the mysterious Illinois Mud Turtle.

The Guardians were notified recently that a request for state funding has been approved — the group will receive a portion of the monies collected from the non-game wildlife check-off. Taxpayers due to receive an income tax refund have the option of checking a box on their form to donate $10 to the wildlife fund.

"The Mud Turtle is a very rare animal. It's on the endangered species list," said Hazel Reuter, a member of the Guardians. "Our organization has decided to do all it can to help these animals, in cooperation with the Illinois Department of Conservation."

Not much is known about the Mud Turtle, which hibernates throughout the winter and becomes active in the spring in the sandy regions of northwestern and central Illinois. All of the world's known Mud Turtles live in Illinois, Iowa and Missouri.

The Guardians will begin their five-day project in late May or early June, trapping the turtles in baited traps placed in shallow water.

After the studies are completed, the group plans to prepare a slide show and brochure to inform the residents in the area about one of the least known and appreciated natural resources of Lee County — the elusive Mud Turtle.

NOTES:

SITE DESCRIPTION

Broderick #1. - although this area evidenced qualities required by the Illinois Mud Turtle, no turtles were captured of any species. The pond showed signs of disturbance with dams and such.

Carey #2. - the pond was dug many years ago in a swampy area. There is an active spring at the south end. A 741D3 fine sand ridge is situated on the north end of the pond. The pond was dredged 2 or 3 years ago. No turtles captured.

Kessel #3. #3A. - this area although interesting yeilded only Painted turltes. The surrounding area is used for pasture.

Fredenhagen #4. #4A. #4B. #4C. #4D. #4E. #4F. - this extensive area is the site of many ponds. A number of which are the result of damming. Most have been disturbed. Used predominately for hunting, fishing and pasture. Extensive work has been done for wildlife enhancement. It is the site of many unusual plants and interesting areas, however. Painted Turtles and one Blanding's were surveyed.

Hinton #5. - a wet spot for years. Cattails and willows are prevalent. Tiling has been attempted many times. It has been farmed occassionally. The area dries up frequently but not for long periods. It is home for numerous ducks, muskrats, frogs, etc. Orio sandy loam 200, and 779D Chelsea fine sand are the adjacent soils. No turtles found.

Kant #6. #6A. - swampy area of long standing. Orio mucky sandy loam, ponded 4200 soil present at site. There has been no known disturbance for a number of years. Two Blanding's found here along with seven Painted Turtles.

Kellen #7. #7A. #7B. - although rich in unusual plant species the area had only Painted Turtles, where trapped. This area is used for hunting and fishing. Mr. Kellen is the local contact person for the owner, Kim A. Schmitt, 8504 Concord Dr., Woodstock, IL 60098. Site of Canada goose nesting.

Spears #8 #8A. #8B. - a very interesting area. Site of a large pond with white waterlilies and nearby smaller ponds. Three ponds were trapped. It proved to be the most popular spot for Blanding's. Seven of the thirteen Blanding's were found at this site. Pond # 8B yeilded five Blanding's. Orio mucky sandy loam, ponded, 4200 is the soil associated with the Spears area. The surrounding wooded and open areas are pastured. Some evidence of disturbance. Interesting plant communities survive here. Tuberous Indian Plantain (Cacalia tuberosa) was found growing here.

Zbinden #9. - a low swampy area that has had disturbance. Owners in recent years have been mainly interested in hunting and have managed the land to that end. No turtles found.

Zimmerly #10 #10A. - site of the Illinois Mud Turtle capture. This body of water is again in Orio mucky sandy loam, ponded 4200 soil. An Oakville fine sand 741D3 ridge runs along the south edge. The ridge is home to a medium quality sand prairie, that is becoming quite brushy. Plants present in the area are: (pond #10)

Little bluestem	Leadplant
Big bluestem	Golden Aster
Indian grass	Frostweed
Switch grass	Whorled milkweed
Three-awn	Prickly pear cactus
Round-headed bushclover	Pussytoes
Wild Quinine	Arrow leafed violet
Goat's rue	Spruge
Rattlesnake master	Rush

Blazing star	Cattail
Wormwood	Arrowhead
Needlegrass	Water plantian
	Wild rice

To the north of the pond is a small wooded area, containing Silver Maple, Black Locust, Willow, Cottonwood, Hackberry, Boxelder, Mulberry, berry bushes and grape vines.

There has been no known disturbance to the area for many years. Ownership has changed often. The present owner just acquired the land. A public roadway, part of the old Peoria - Galena Trail borders the east edge of the water. The road has minimal use and maintenance.

Pond #10A. to the east is a swampy area with much vegetative growth. This site was trapped one day only and one Painted Turtle was captured.
